

星系天文学《二》： 星系的统计性质

沈世银

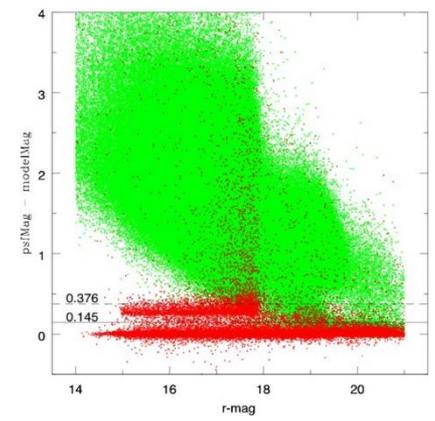

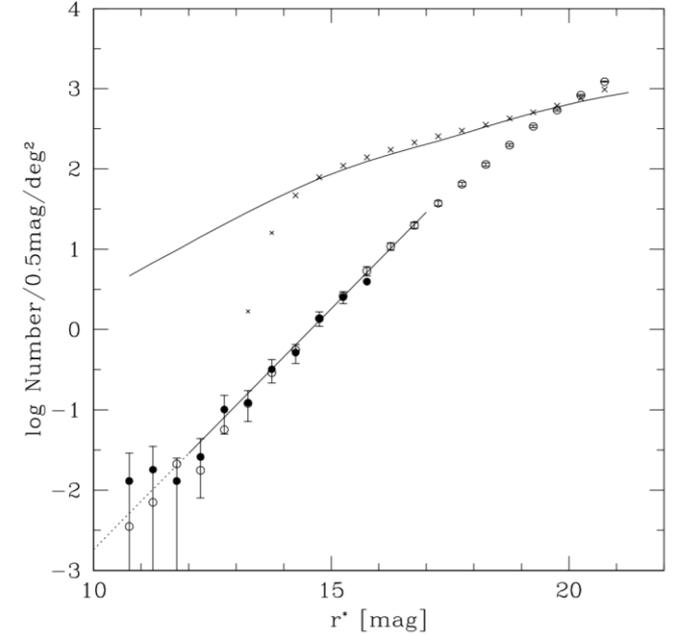

目录

- **星系性质的分布函数**
 - 星等、光度、质量
 - 不同波段
 - 不同质量成份
 - 空间分布
- **条件分布函数**
- **标度律 (scaling relation)**

(一) 星系性质的分布函数

1、星系的数目分布 (number counts)

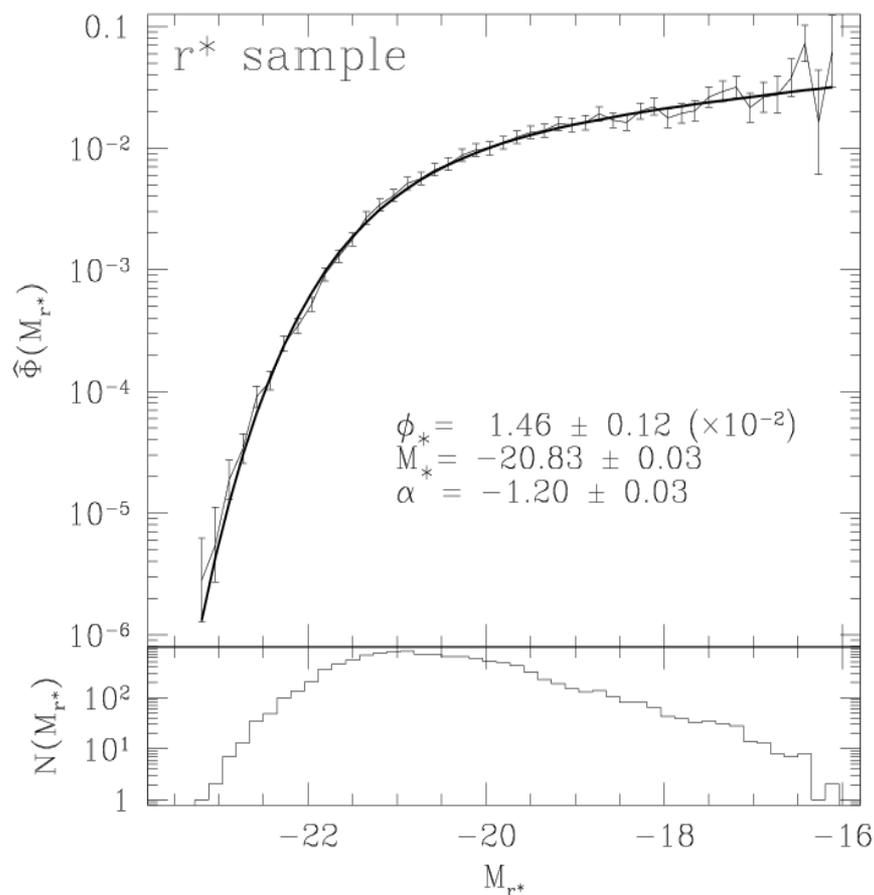

- $N(m)$: 单位立体角里面单位星等星系的数目
- 如果欧几里得空间, 星系的数密度是常数
 - $\text{Log } N(m) = 0.6 m + \text{const.}$
 - 奥博斯佯谬
- 星系计数
 - 星系光度函数及演化
 - 宇宙学
 - 银河系尘埃消光

2、星系的光度函数 (luminosity function)

- 星系的光度函数

- 最基本的分布函数
- 单位体积单位光度 (星等) 范围内星系的数目
 - 暗星系多, 亮星系少
- 观测的数目? 多? 少

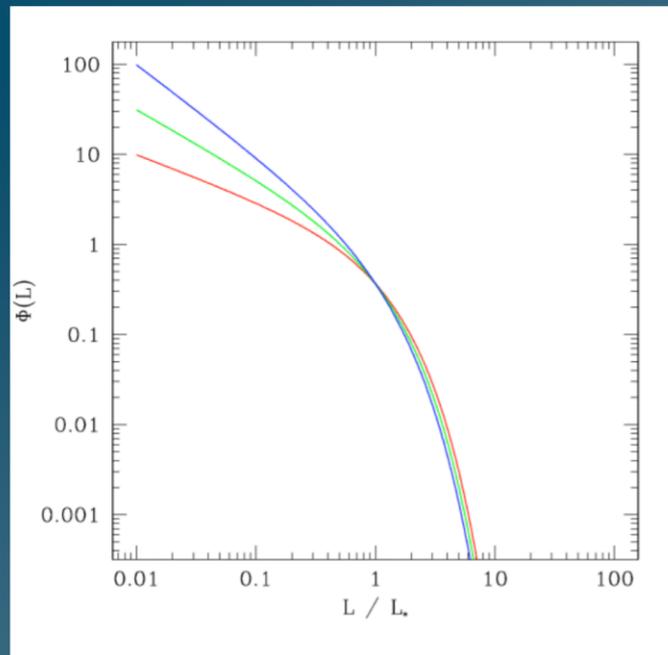

Schechter 函数

$$\Phi(L)L = \Phi_* \left(\frac{L}{L_*}\right)^\alpha \exp(-L/L_*) \frac{L}{L_*}$$

- Φ_* (光度密度)
- α (暗段斜率)
- L_* (特征光度)

$\alpha = -0.5$ (red), $\alpha = -0.75$ (green), $\alpha = -1$ (blue):

- 星系的数密度
 - 如果 $\alpha < -1$, n 发散
- 星系的光度密度
 - 由 L_* 星系主导

$$n = \int_L^\infty \Phi(L) dL$$

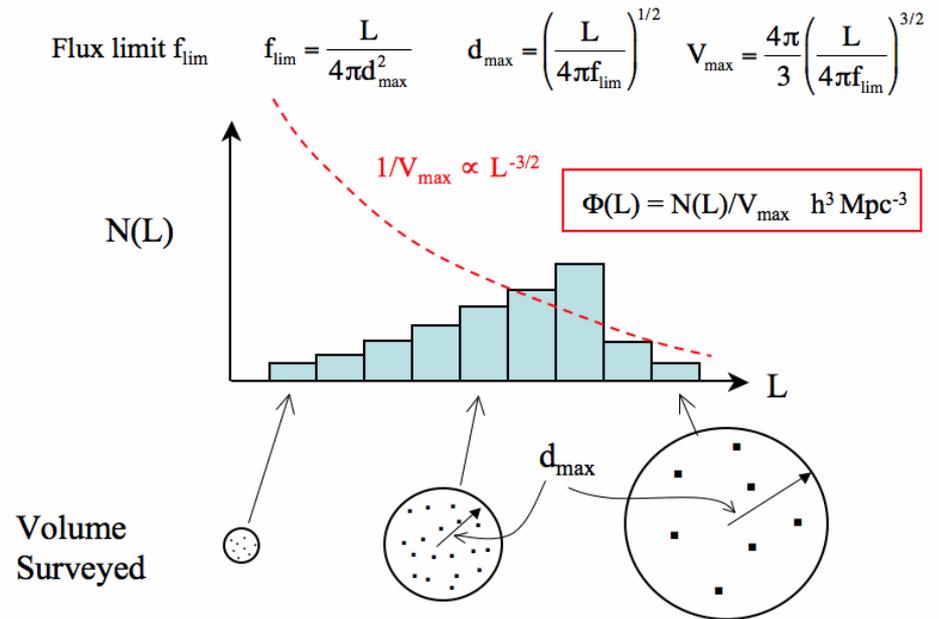

$$\int_L^\infty \Phi(L) L dL$$

$$\phi(M) = \frac{\ln 10}{2.5} \phi_* \left(10^{0.4(M^* - M)}\right)^{(\alpha+1)} \exp\left[-10^{0.4(M^* - M)}\right]$$

光度函数的计算

- 体积完备样本
- 星等完备样本
 - SDSS主星系样本 $r < 17.77$
 - 亮星系更容易被观测到
 - V_{\max} :
 - 星系在星等完备样本中能观测到的最大体积范围
 - $\langle V/V_{\max} \rangle \sim 0.5$

$1/V_{\max}$ corrections for Malmquist bias

最大似然法

- <https://core.ac.uk/download/pdf/25215650.pdf>
- Sandage, Tammann & Yahil (1979): STY

$$p(M_i, z_i) = \frac{\phi(M_i)}{\int_{-\infty}^{M_{faint}(z_i)} \phi(M) dM}.$$

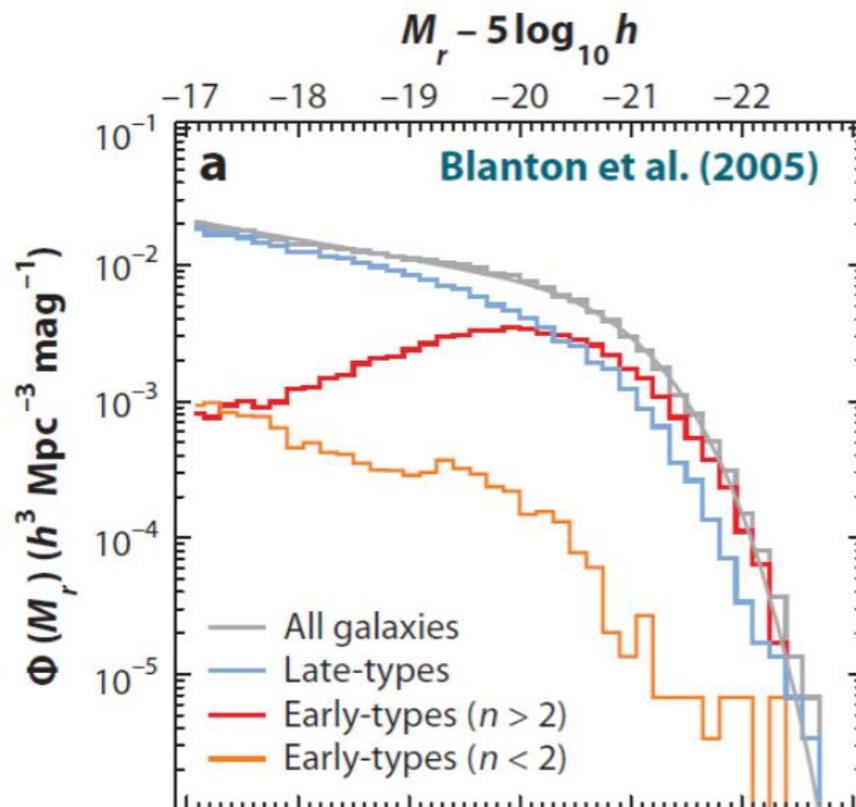

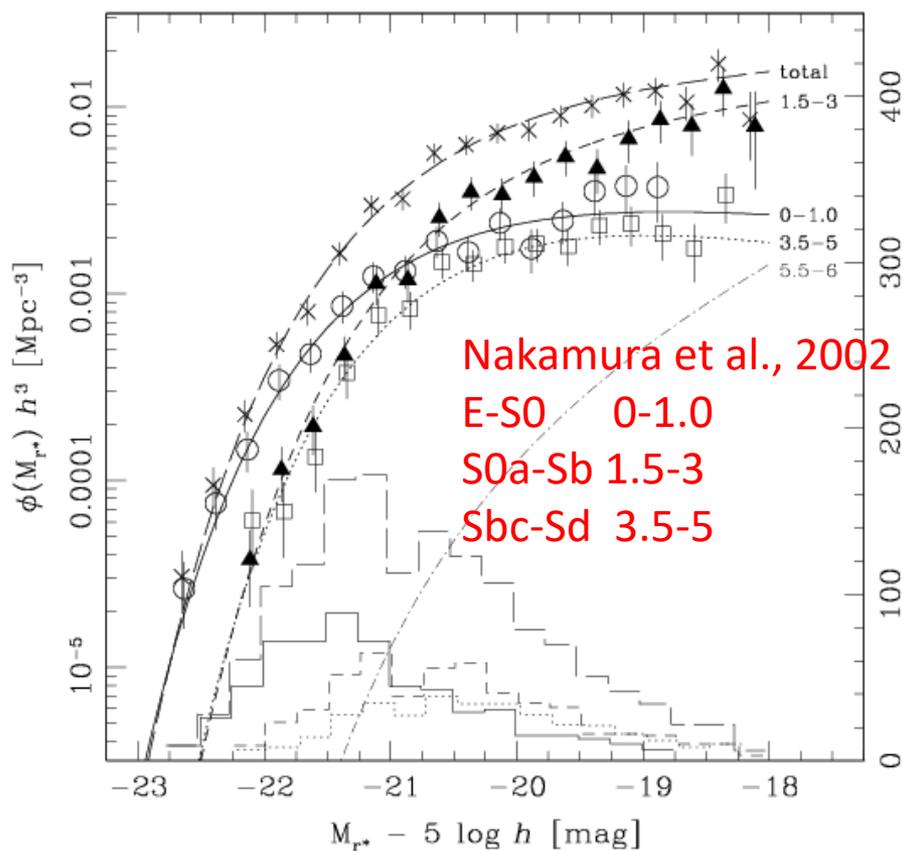

$$\mathcal{L} = \prod_{i=1}^{N_g} p(M_i, z_i).$$

- Efstathiou, Ellis & Peterson (1988, EEP) derived the stepwise maximum likelihood method (SWML)
 - 非参数化的光度函数形式

光度函数计算中的细节

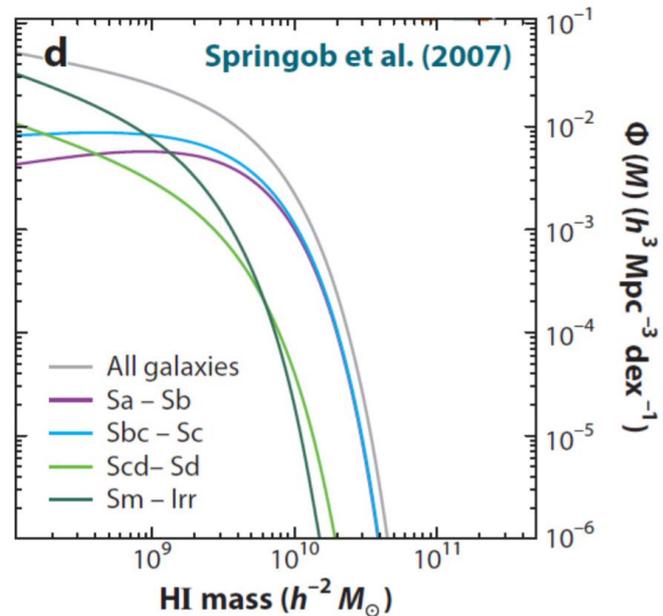

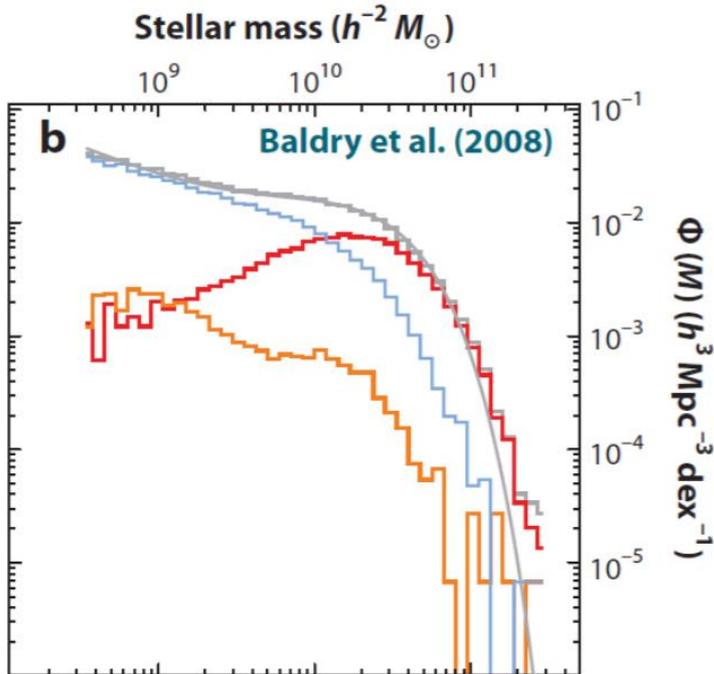

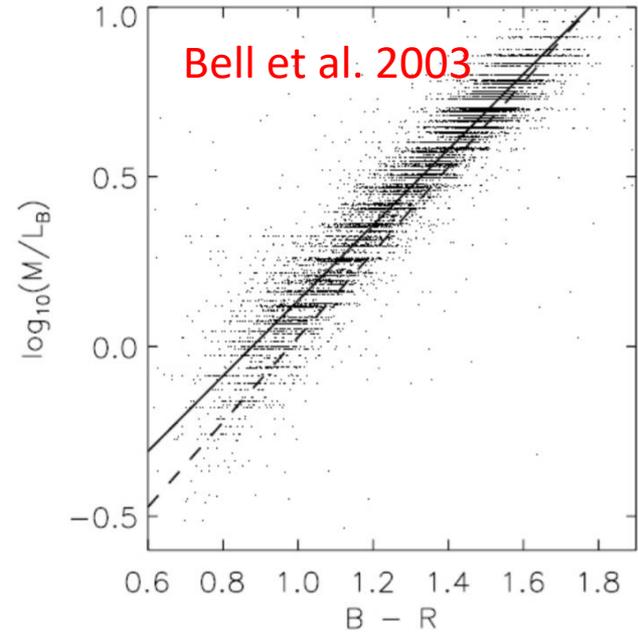

- K改正
- 演化效应改正
- 完备性改正：
 - 低表面亮度星系

子样本的光度函数

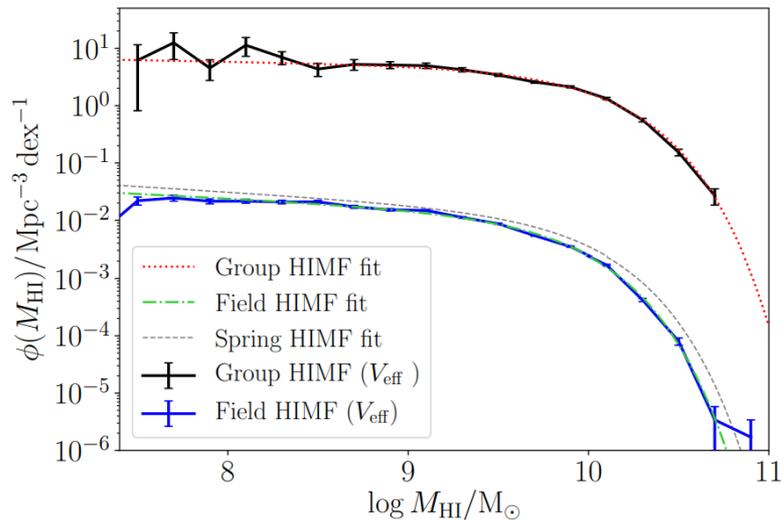

2.1 质量函数

- $\Phi(M)$
 - 恒星质量, 气体质量等
 - 质光比: 从颜色推算
 - 星族, IMF

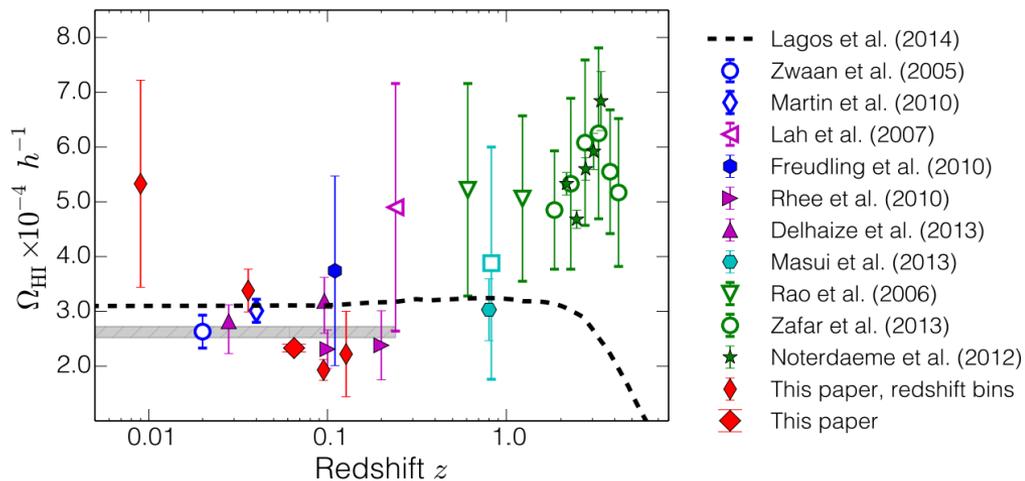

HI mass function

Jones et al. 2020

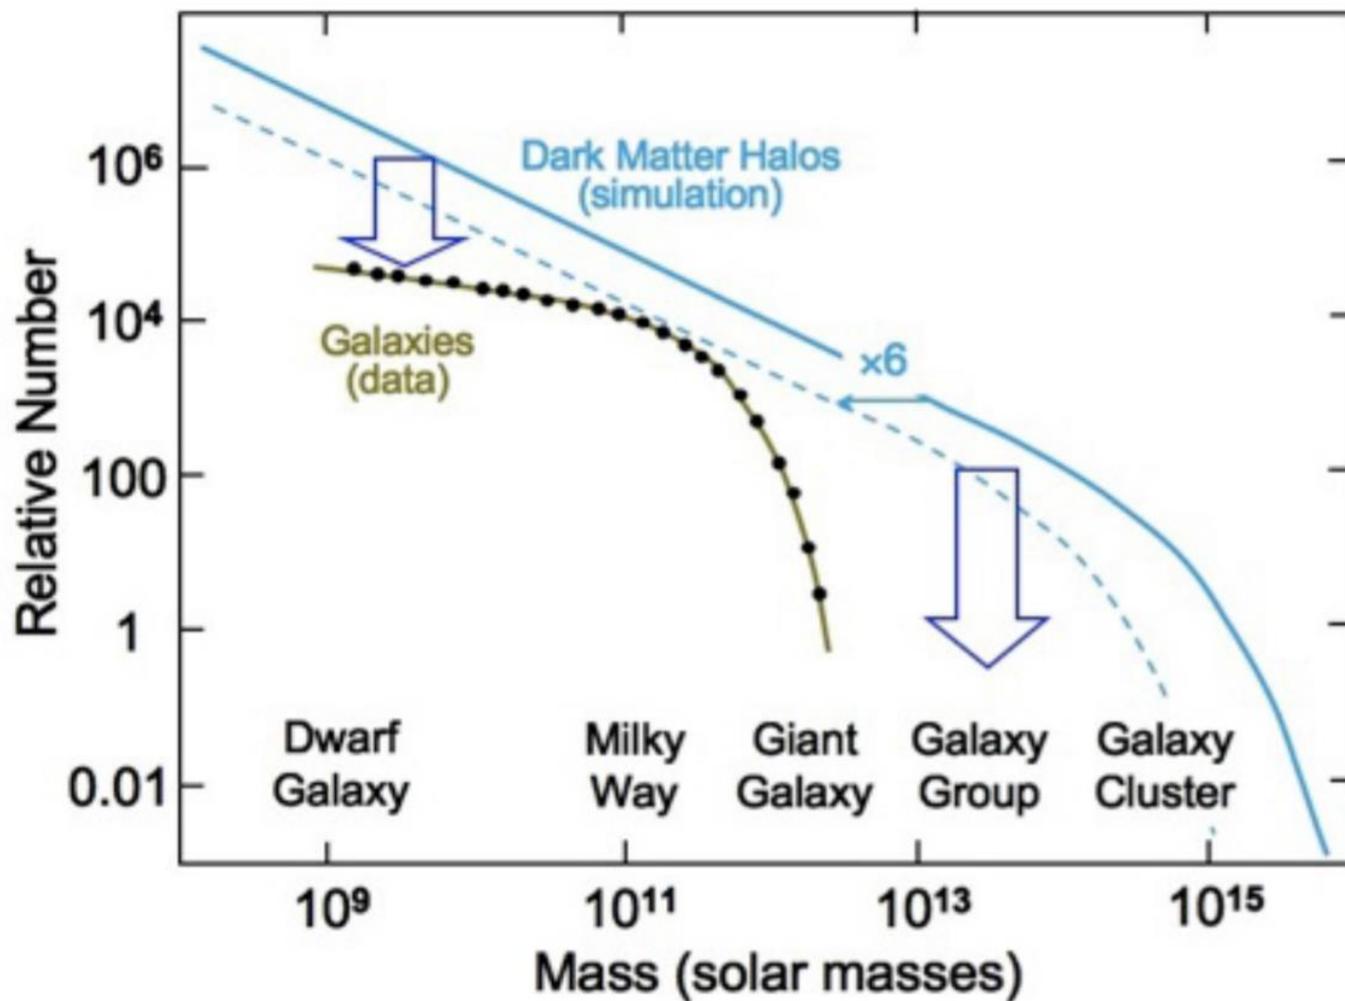

Hoppmann et al. 2015

结合HI和恒星质量函数可以更好的理解星系中的恒星形成过程

Halo and Galaxy Mass Distributions

作业1

- 单位平方度内，有多少 $r < 20.5$ mag 的星系？
- SDSS给出的本地星系的Schechter光度函数的参数为 $M_r^* = -20.83$ ， $\alpha = -1.0$ ，请问单位体积范围内 $M_r = -16$ mag的星系数目是 $M_r = -22$ mag星系数目的多少倍？SDSS是星等极限样本 ($r < 17.77$)，请问在SDSS的观测样本中， $M_r = -22$ mag的星系数目是 $M_r = -16$ mag星系数目的多少倍？

3. 星系的空间分布 <http://arxiv.org/abs/1202.6633>

- 两点相关函数

- 三维 $dP_{12} = \bar{n}^2 \{1 + \xi_{12}(r)\} dV_1$

- 二维 $dP = N[1 + \omega(\theta)]d\Omega$

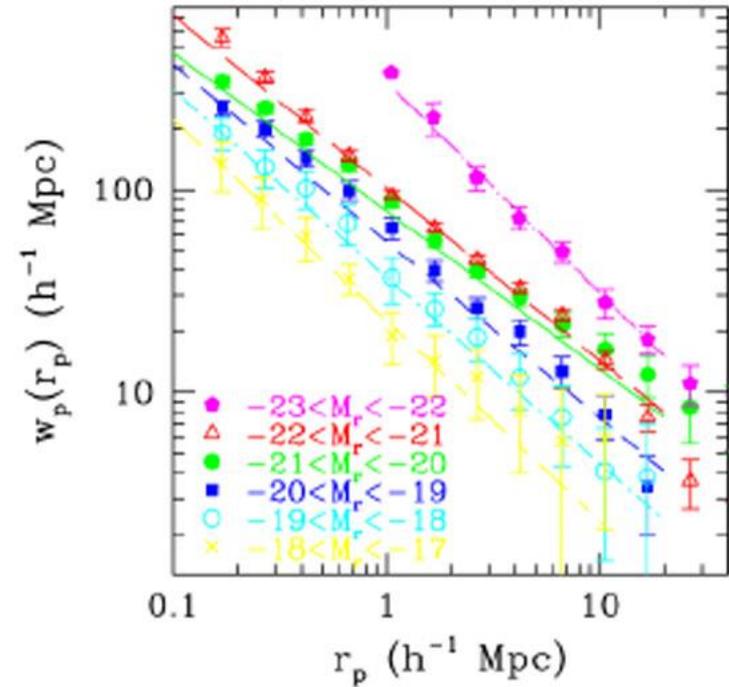

$$\hat{\xi}_{DP}(r) = \frac{N_R}{N_D} \frac{DD(r)}{DR(r)} - 1 \quad \text{Davis and Peebles (1983)}$$

- 幂率函数 $\xi(r) = \left(\frac{r}{r_0}\right)^{-\gamma}$

- r_0 : 相关长度

- 参数和样本（光度/质量）相关

- 自相关，交相关

红移畸变 (redshift distortion)

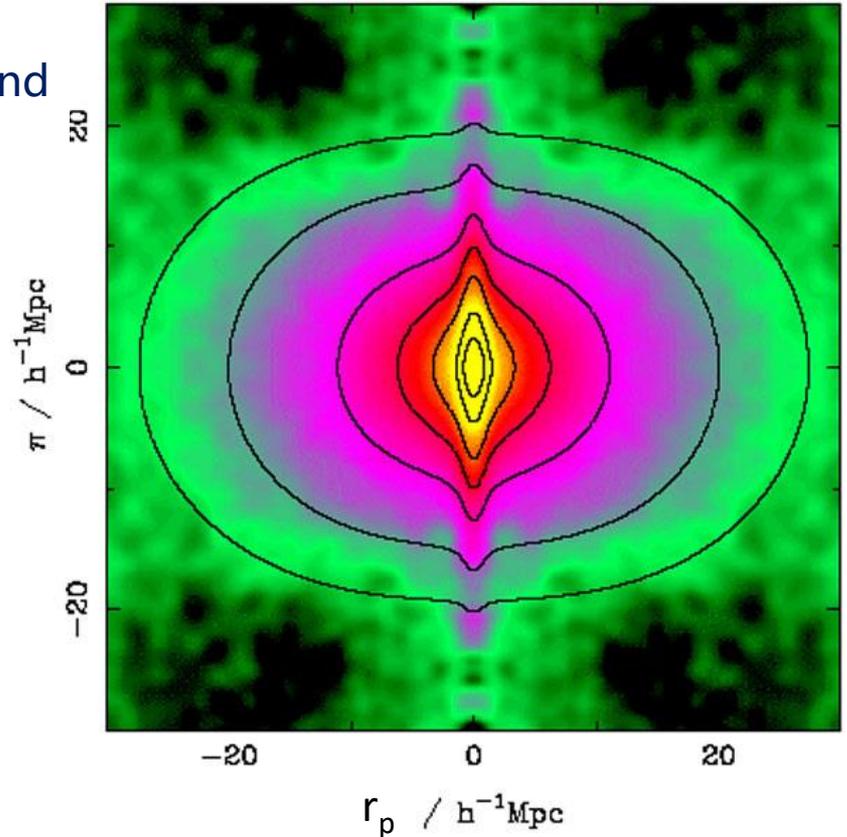

\mathbf{v}_1 and \mathbf{v}_2 are defined to be the redshift positions of a pair of galaxies

- $\mathbf{s} = (\mathbf{v}_1 - \mathbf{v}_2)$ to be the redshift space separation
- $l = 1/2 (\mathbf{v}_1 + \mathbf{v}_2)$ to be the mean distance to the pair

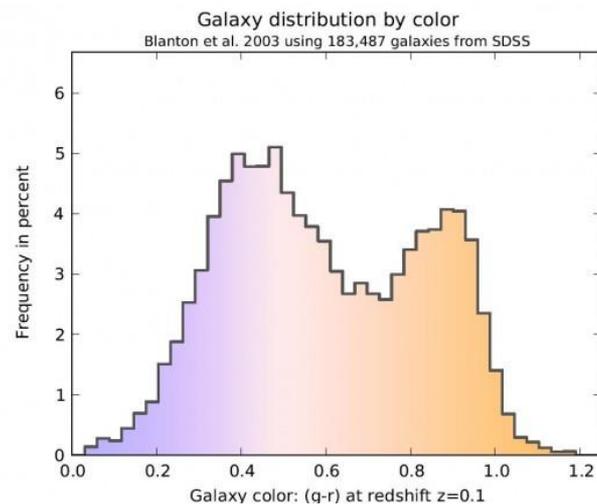

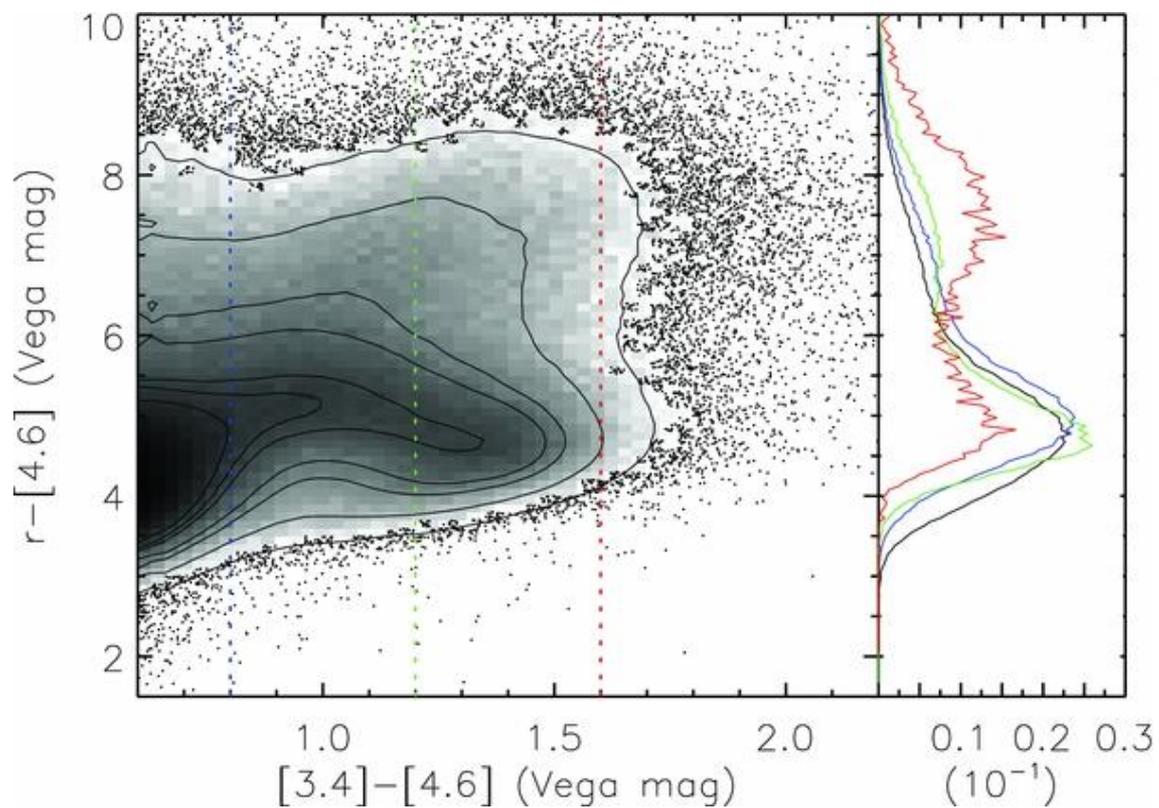

Separation between two galaxies across (r_p) and along (π) the line of sight

$$\pi = \frac{\mathbf{s} \cdot \mathbf{l}}{|\mathbf{l}|},$$
$$r_p = \sqrt{\mathbf{s} \cdot \mathbf{s} - \pi^2}.$$

- 小尺度
 - Finger of God
 - 星系团中星系的随机运动
- 大尺度
 - Kaiser effect
 - 大尺度上星系的引力成团效应

4、星系的颜色分布

为什么是双峰分布？

(二) 星系的条件分布函数

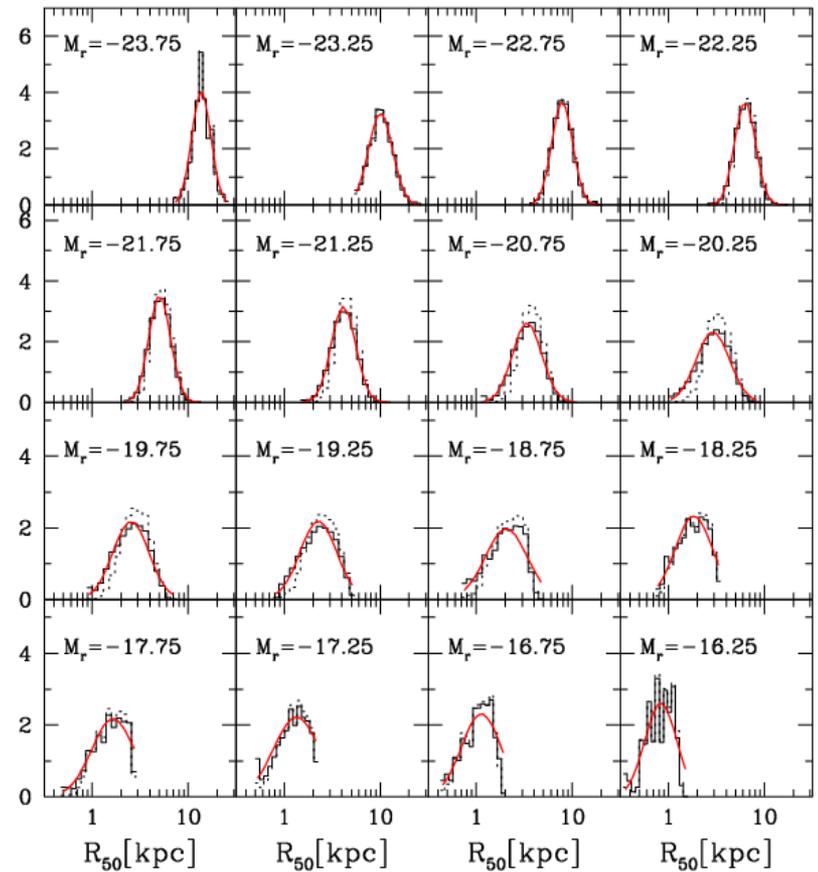

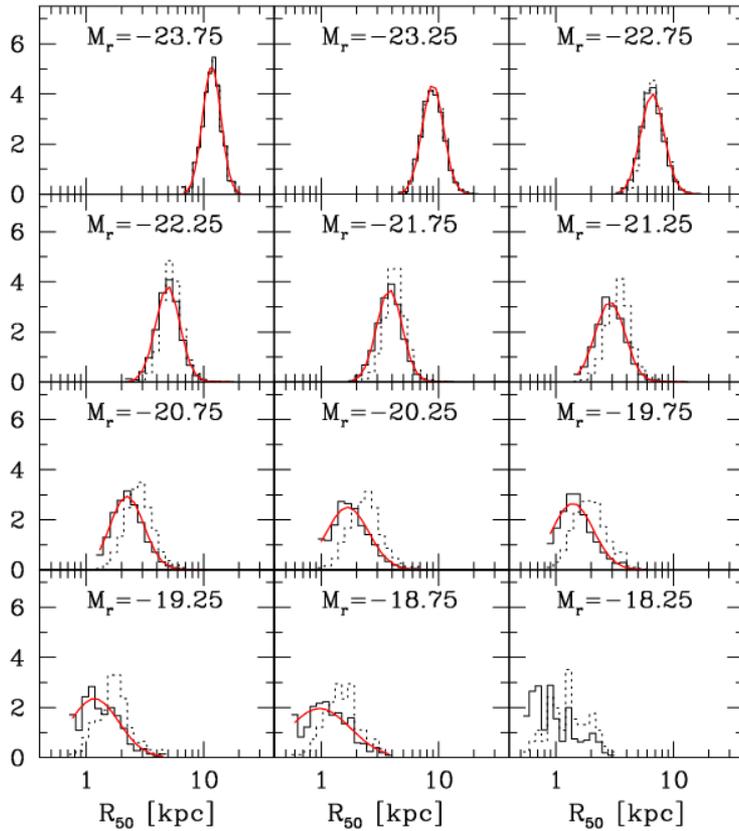

- 第一参量：质量
 - 可以是恒星质量（观测研究）
 - 也可以是暗晕质量（模型研究）

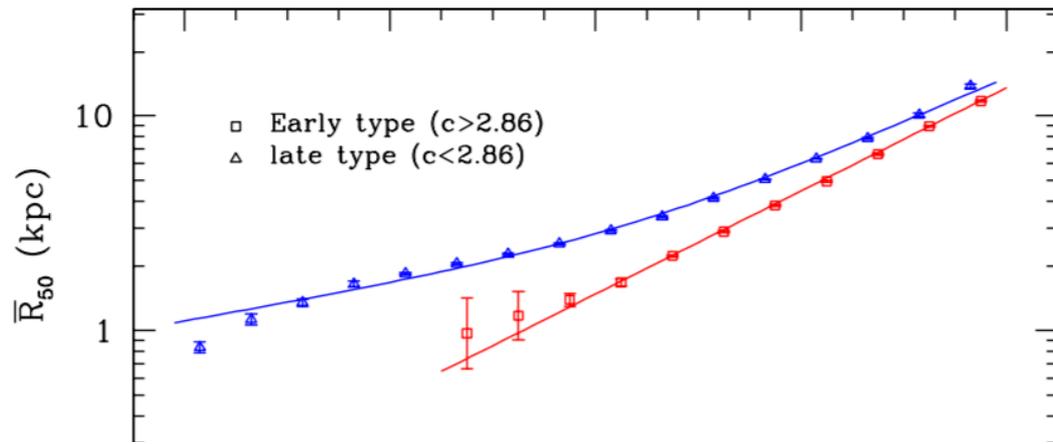

- 其它参量
 - $f(R|M)$
 - $f(\text{color}|M)$
 -

星系尺度的分布函数(Shen et al. 2003)

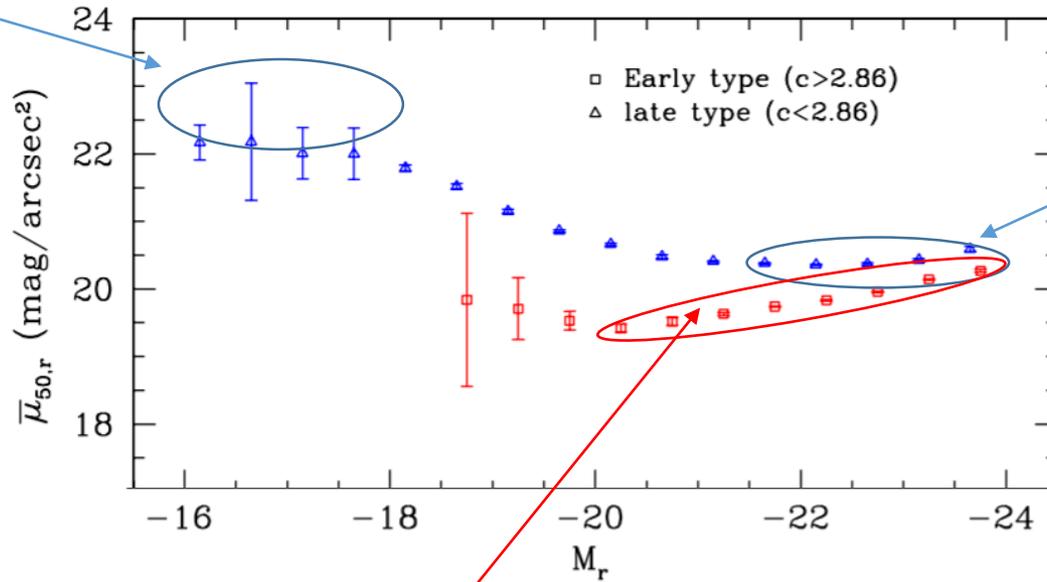

Early type $c > 2.86$

Late type $c < 2.86$

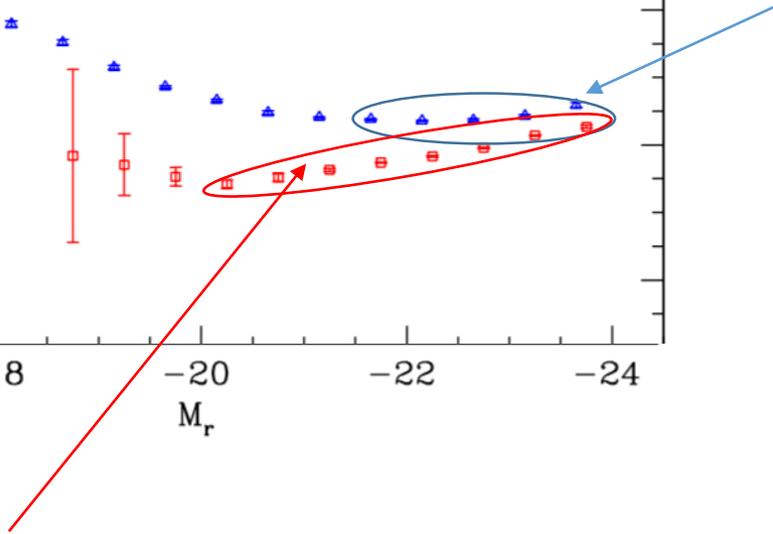

Low surface brightness galaxies

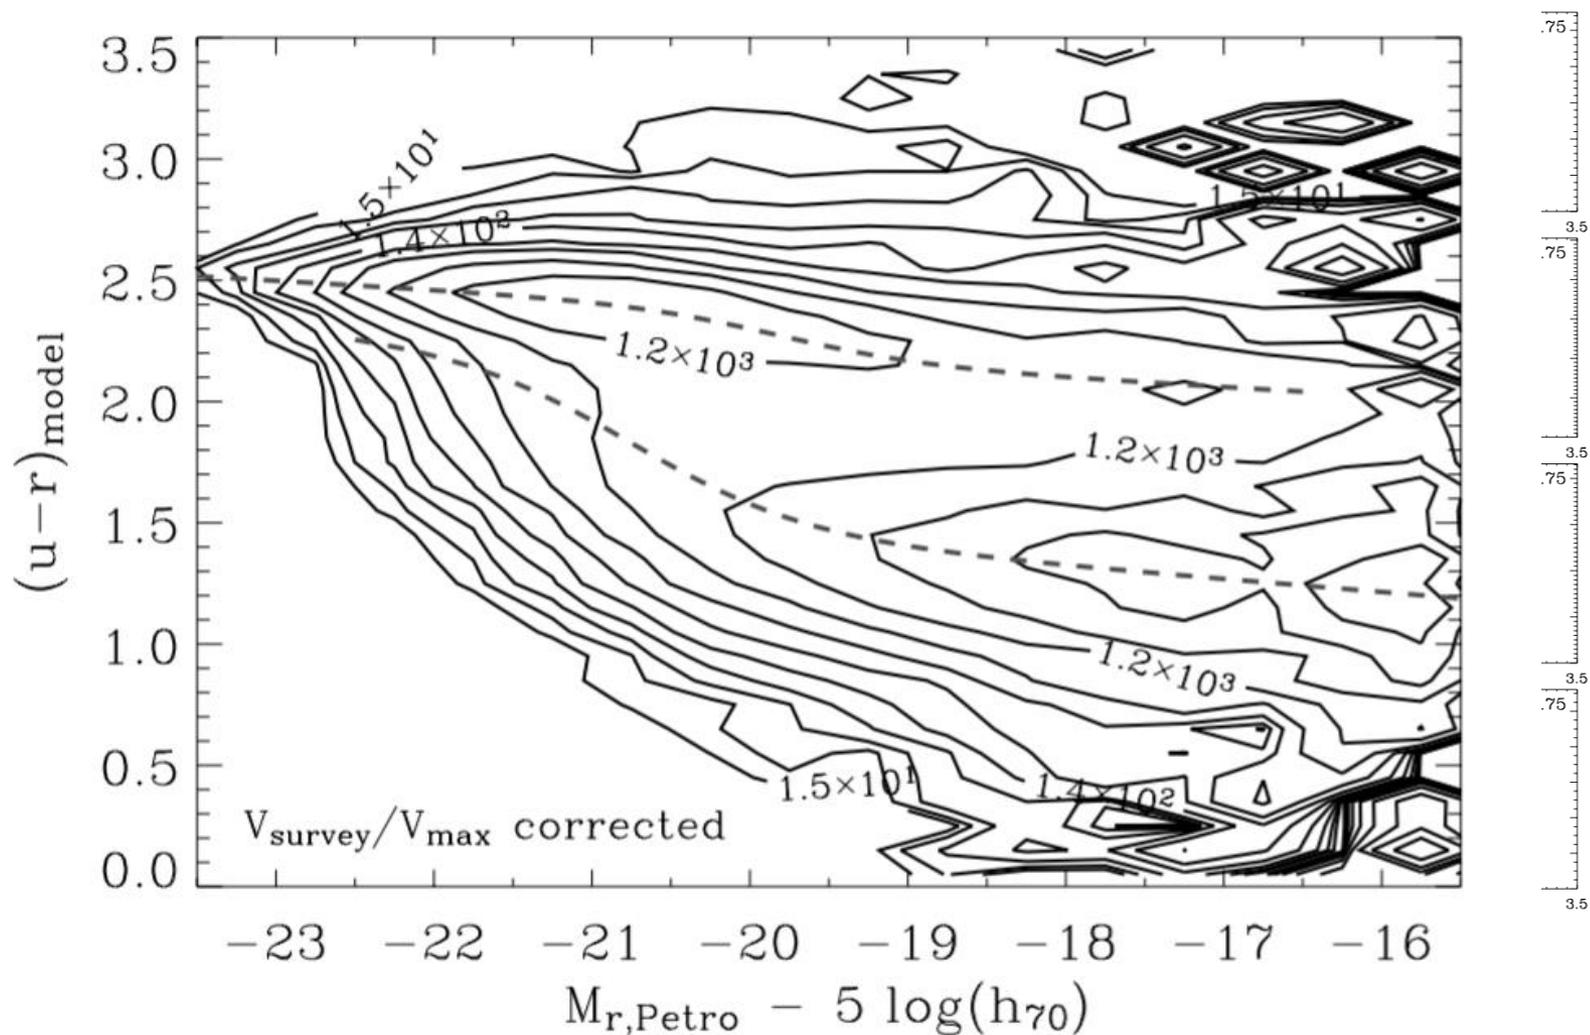

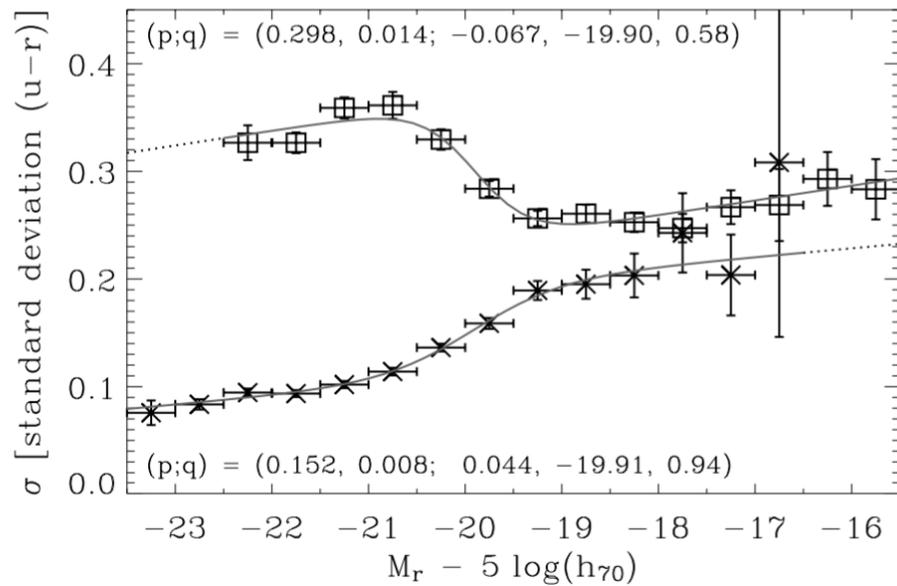

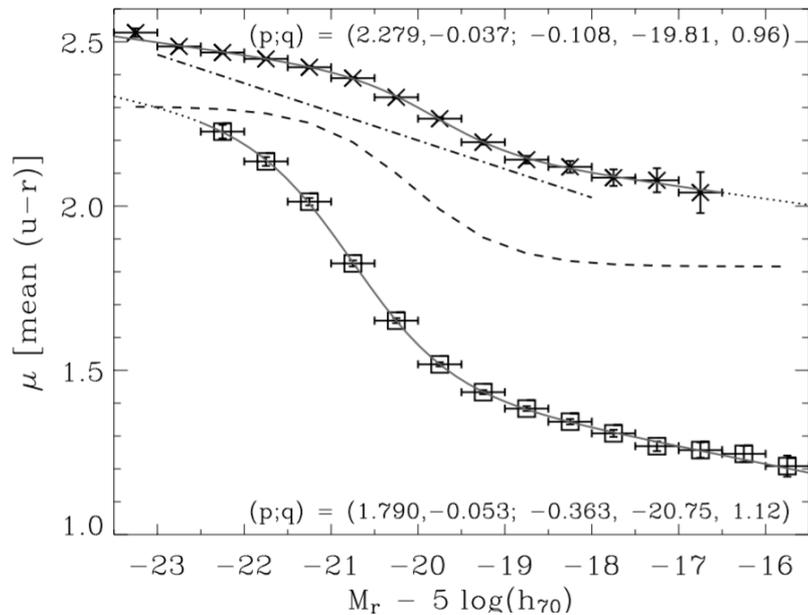

Freeman law 1970

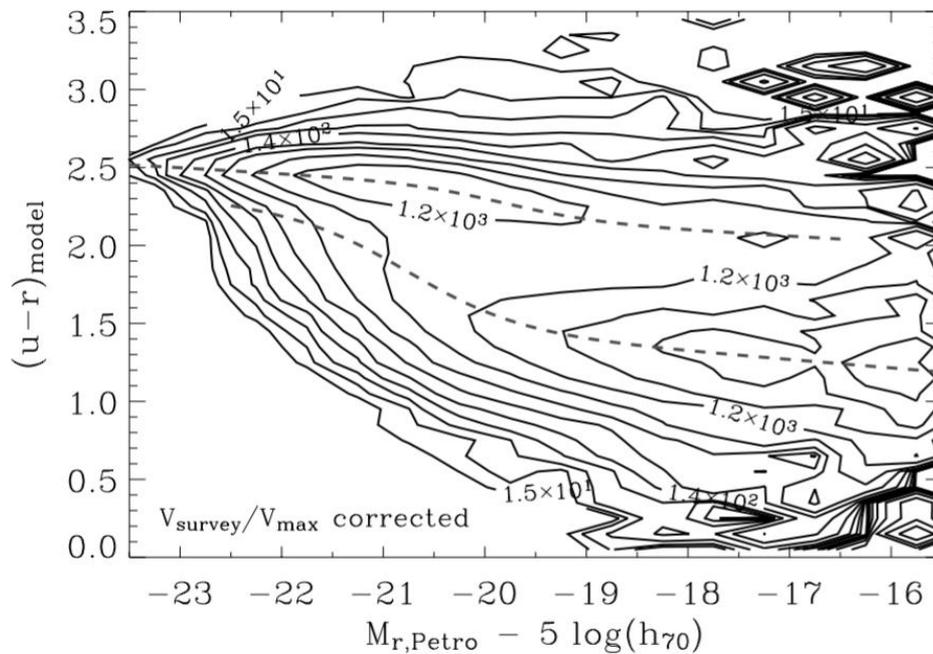

Kormendy relation 1977

星等颜色分布(Baldry et al. 2004)

Baldry et al. 2004

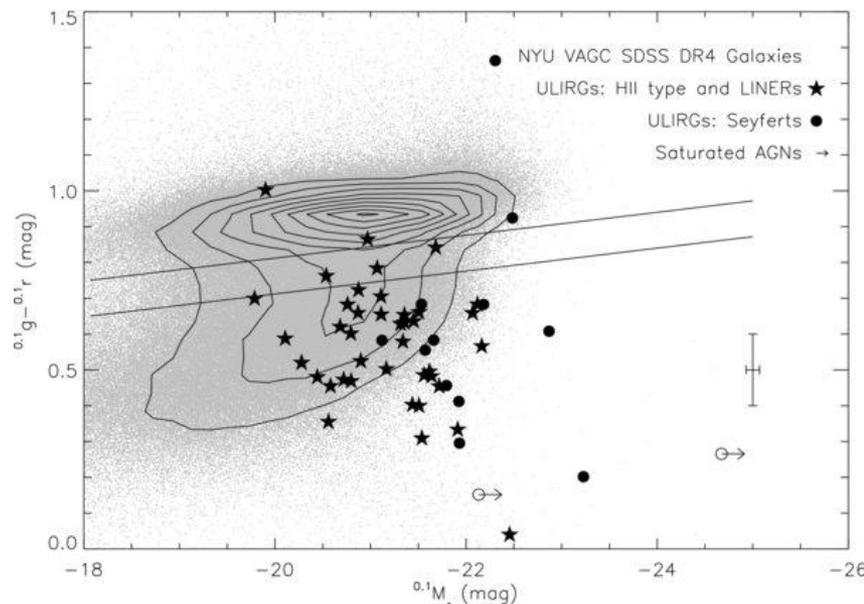

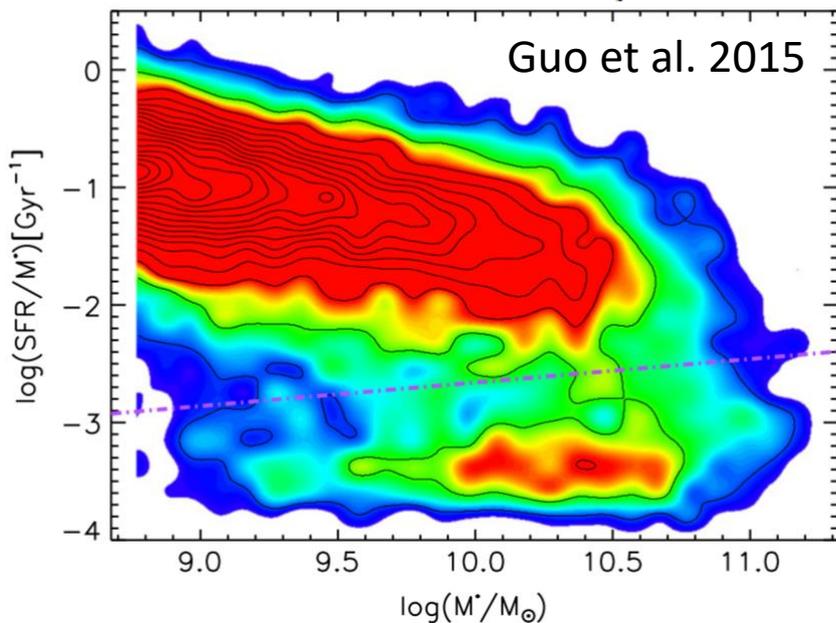

颜色-星等关系 (标度关系?)

- sSFR-质量 (光度) 关系
- SFR-质量 (光度) 关系
 - Main sequence

$$\log(\text{sSFR}_t) = \alpha \times \log(M^*/10^{10.5} M_\odot) + \beta$$

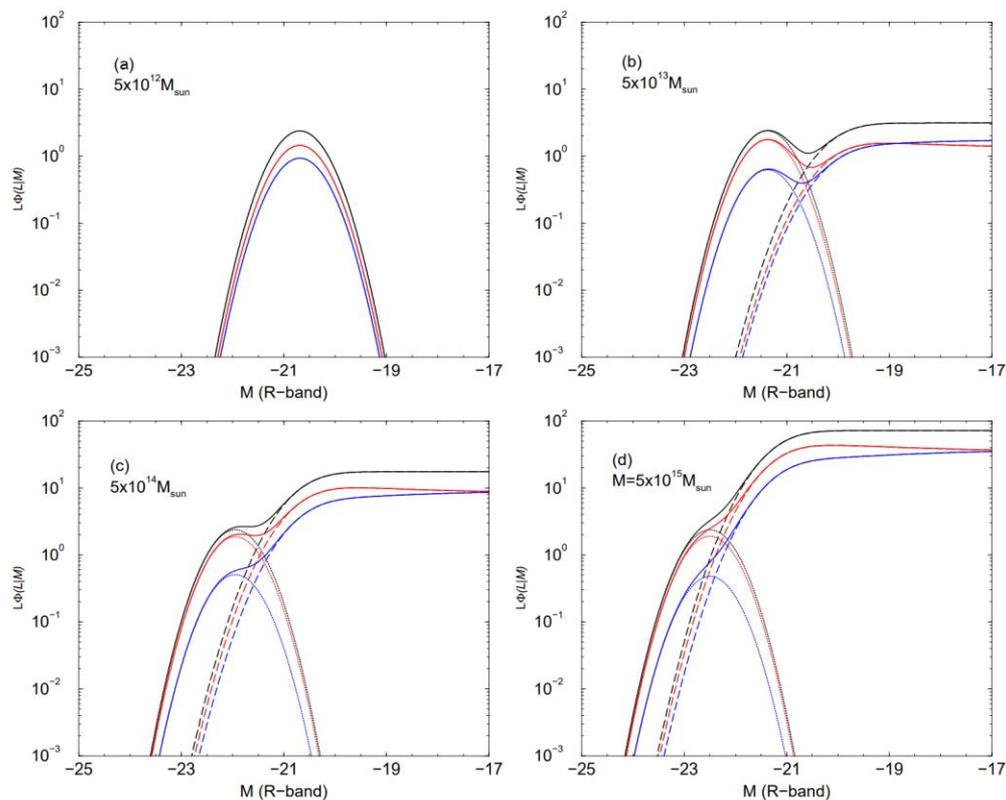

$\alpha = -0.44$ and $\beta = -1.68$.

基于暗晕质量的Conditional luminosity function model (Yang et al., 2003, 2005)

- 暗晕 \rightarrow 星系群
- 大星系+卫星星系
- 中央星系, 卫星星系
- Halo Occupation Distribution (HOD)
- 条件分布函数和两点相关函数结合
 - 从统计上完全Mock星系的分布

Cooray 2005

(三) 标度率 (scaling relation)

- 定理:
 - $F=ma$
- 量纲
- 弥散
 - 观测误差
 - 内禀弥散

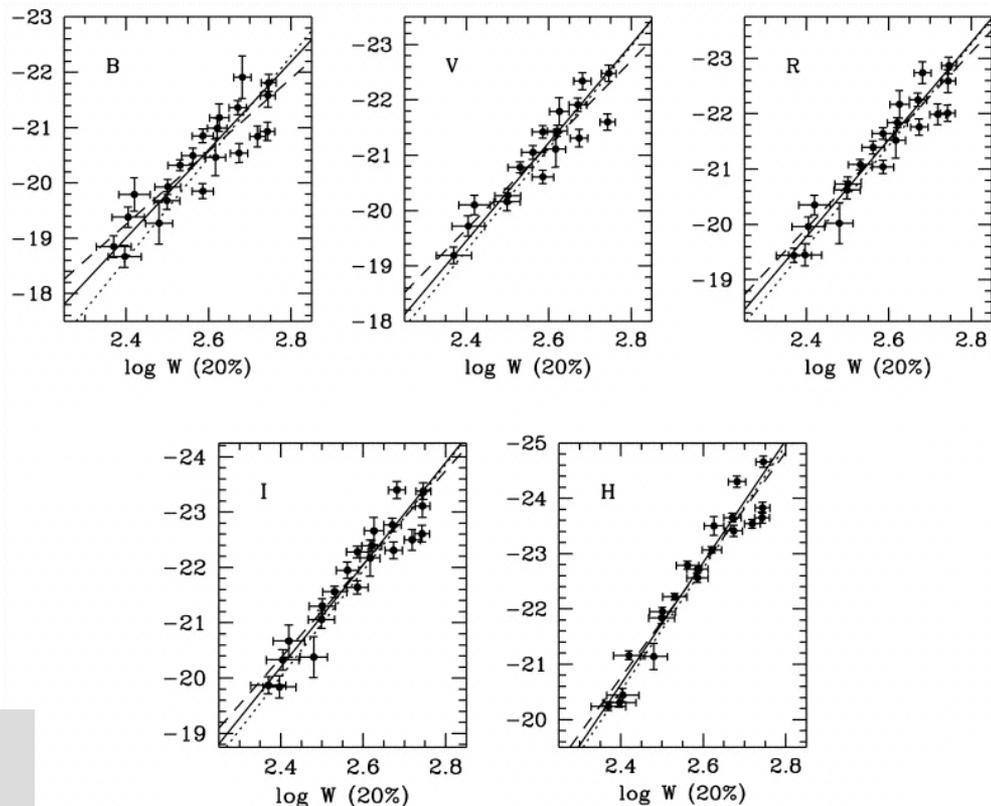

3.1 动力学标度关系

- 星系中各种组分在质量上的关系
 - Tully-Fisher关系
 - Faber-Jackson关系
 - Fundamental plane
 - M-sigma 关系
- 注意：大城市里面酒吧多，书店也多
 - 相关性 不等于 因果性

旋涡星系的 Tully-Fisher关系(1977)

- $M = a \log W + b$
 - $L = a * V^\alpha$ ($\alpha \approx 4$)
- 弥散: ~ 0.2 个星等
- W 的测量:
 - 不依赖于距离
- 测定星系的距离

*BVRIH*_{0.5} Tully-Fisher relations for spiral galaxies with Cepheid distances, using 20% line width. Solid lines represent the bivariate fits, while the dotted and dashed lines represent inverse and direct fits, respectively.

$$L_H \approx 3 \times 10^{10} \left(\frac{V_{\max}}{196 \text{ km/s}} \right)^{3.8} L_{H,\text{solar}}$$

The "Physics" of Tully-Fisher

gravity: $V^2 = \frac{GM}{R} \Rightarrow M \sim RV^2$

mass-to-light ratio: $M = L \left(\frac{M}{L} \right)$

surface brightness: $\Sigma_{SB} = \frac{L}{\text{area}} \sim \frac{L}{R^2} \Rightarrow L \sim R^2 \Sigma$

so
 $m \sim M$

$$RV^2 \sim L \left(\frac{M}{L} \right)$$

$$\sqrt{\frac{L}{\Sigma}} V^2 \sim L \left(\frac{M}{L} \right)$$

$$L \sim \frac{V^4}{\Sigma \left(\frac{M}{L} \right)^2}$$

$$M_{\text{halo}} = \rho_{200} \cdot \frac{4}{3} \pi R_{200}^3$$

$$V_c^2 = \frac{GM_{\text{halo}}}{R_{200}}$$

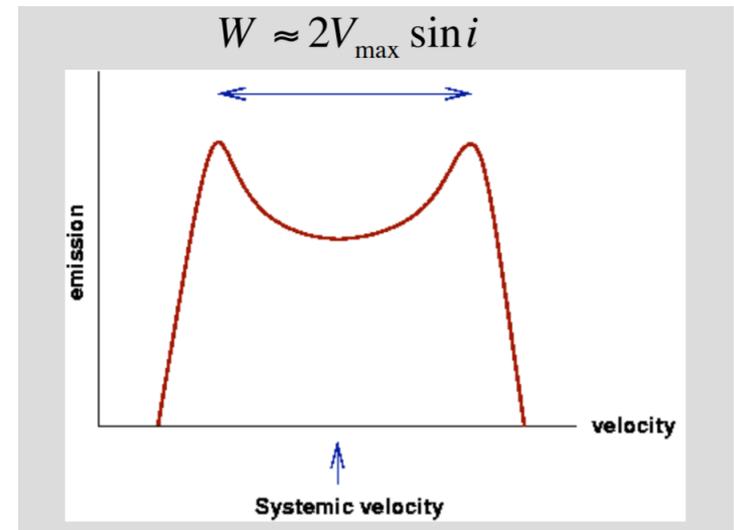

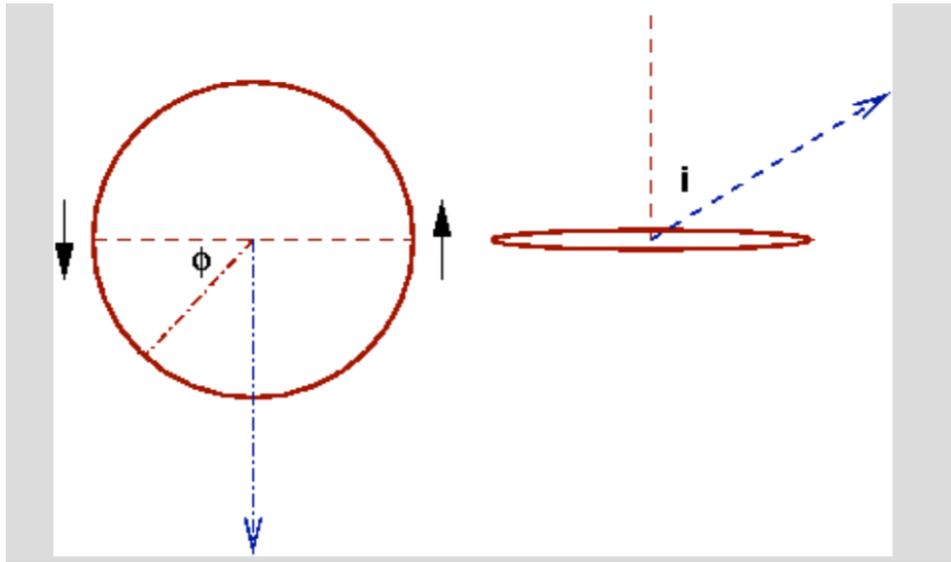

$$V_c \propto R_{200}$$

$$M_{\text{halo}} \propto V_c^3$$

$$M^* \text{ --- } M_{\text{halo}}$$

旋转速度的测量

$$V_r(R, i) = V_{sys} + V(R) \sin i \cos \phi$$

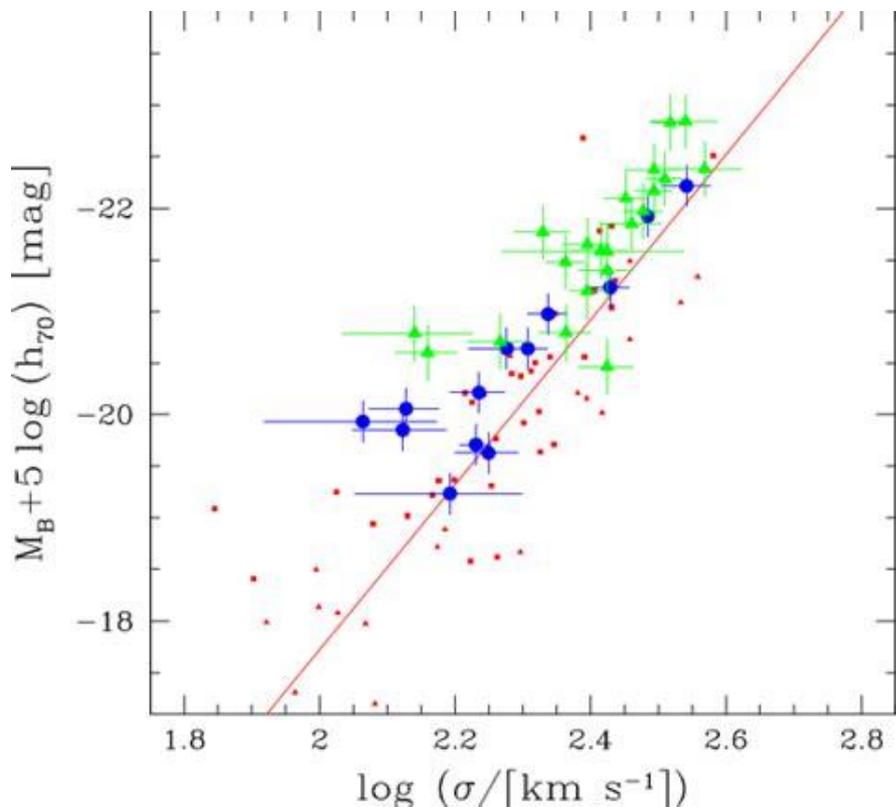

椭圆星系的Faber-Jackson关系 (1976)

- $L \propto \sigma^4$

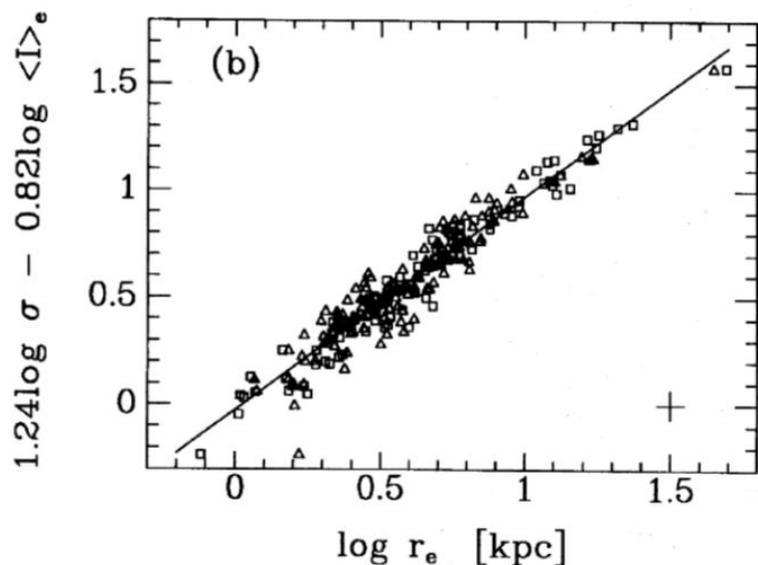

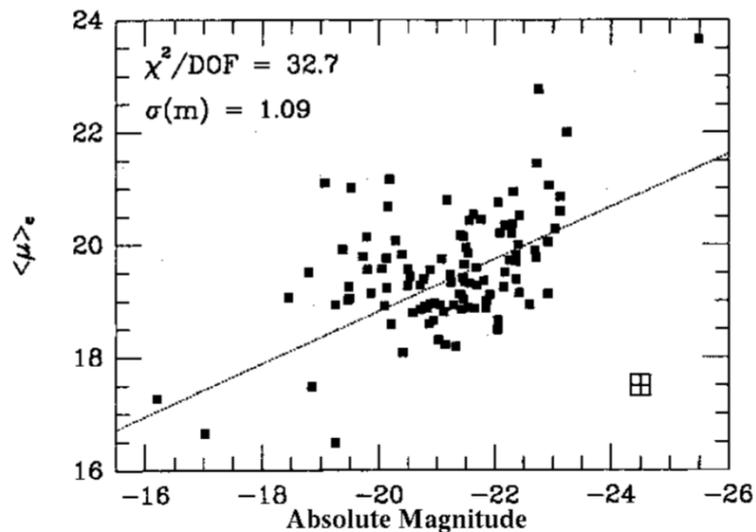

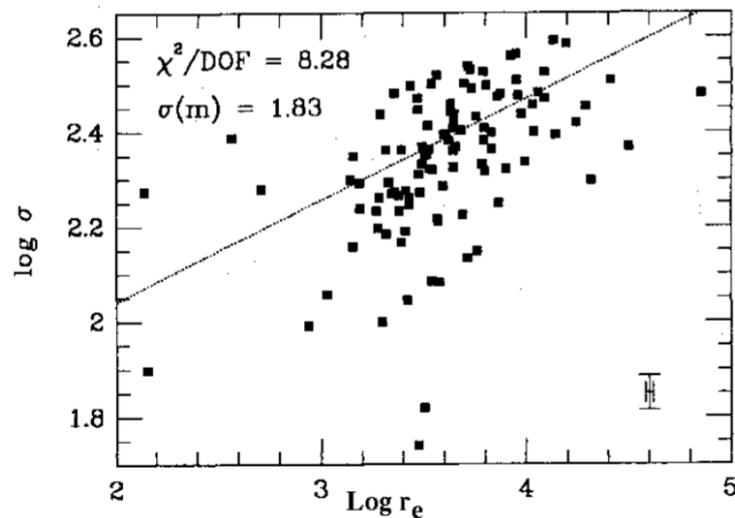

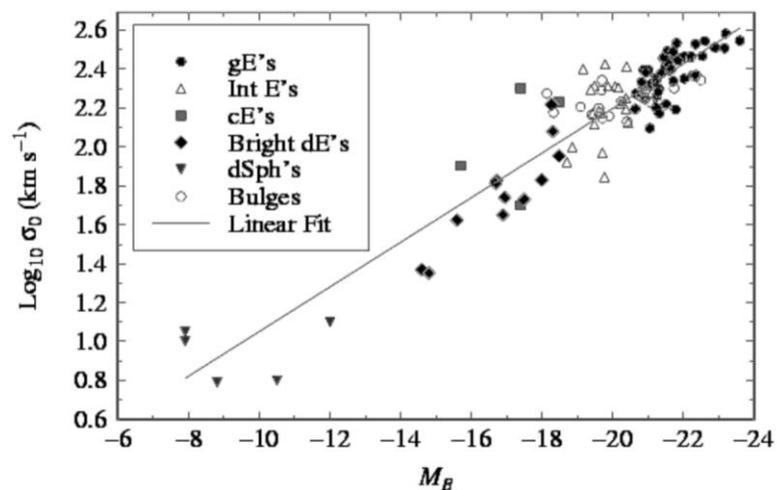

- σ : 恒星的速度弥散度

- 关系的弥散 $\sim 0.4\text{mag}$

$$\sigma = \sqrt{\frac{\sum_{i=0}^N (v_i - \bar{v})^2}{N}}$$

基本面 (fundamental plane)

维里定理 $2K + U = 0$

$$U = -\frac{3}{5} \frac{GM^2}{R} \quad (\text{半径为 } R, \text{ 质量为 } M) \text{ 等密度}$$

$$K = \frac{3}{2} M \omega^2$$

$$\omega^2 \propto G \frac{M}{R}$$

设 M/L 常数 $M \propto L$?

表面高度 $M = \frac{L}{\pi R^2}$

M : 常数?

$$L \propto \frac{\omega^4}{G^2 M}$$

基本面

$$r_e \propto \sigma^{1.24} \langle | \rangle^{-0.82}$$

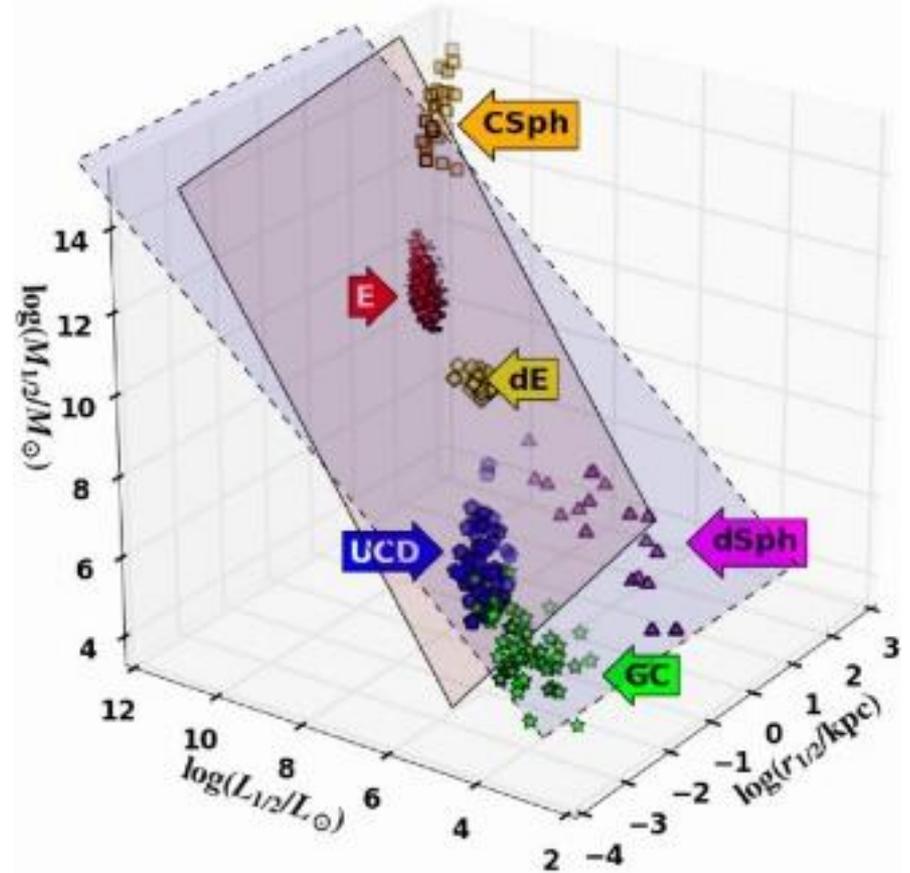

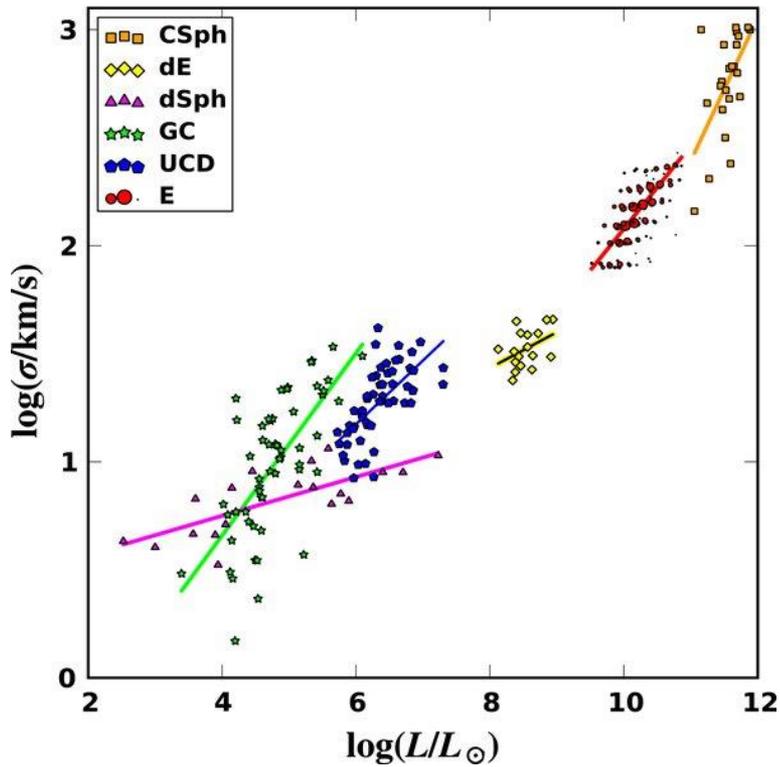

- 可以测定距离
 - l_e , σ 的测量不依赖于距离
- 偏离维里面
 - 星系的质光比是常数吗?

$$\sigma_r^2 = \frac{1}{3} \gamma \frac{GM_{\text{dyn}}}{\frac{4}{3}R_h} = \frac{1}{2} G \gamma \frac{\frac{1}{2}L}{R_h^2} \frac{M_{\text{dyn}}}{L} R_h \propto IY R_h \quad (3)$$

其中, Y 为系统的质光比, $Y = M_{\text{dyn}}/L$, L 为系统的光度; I 为半质量半径处对应的平均面亮度, $I \propto \frac{1}{2}L/R_h^2$ 。质光比可以分解成重子物质比例的倒数 (M_{dyn}/M_* , M_* 为系统的恒星质量) 与恒星质光比 (M_*/L) 的乘积: $M_{\text{dyn}}/L = M_{\text{dyn}}/M_* \times M_*/L$ 。若质光比 Y 为常数, 则式 (3) 可以表示为:

$$\sigma^2 \propto I R_h \quad (4)$$

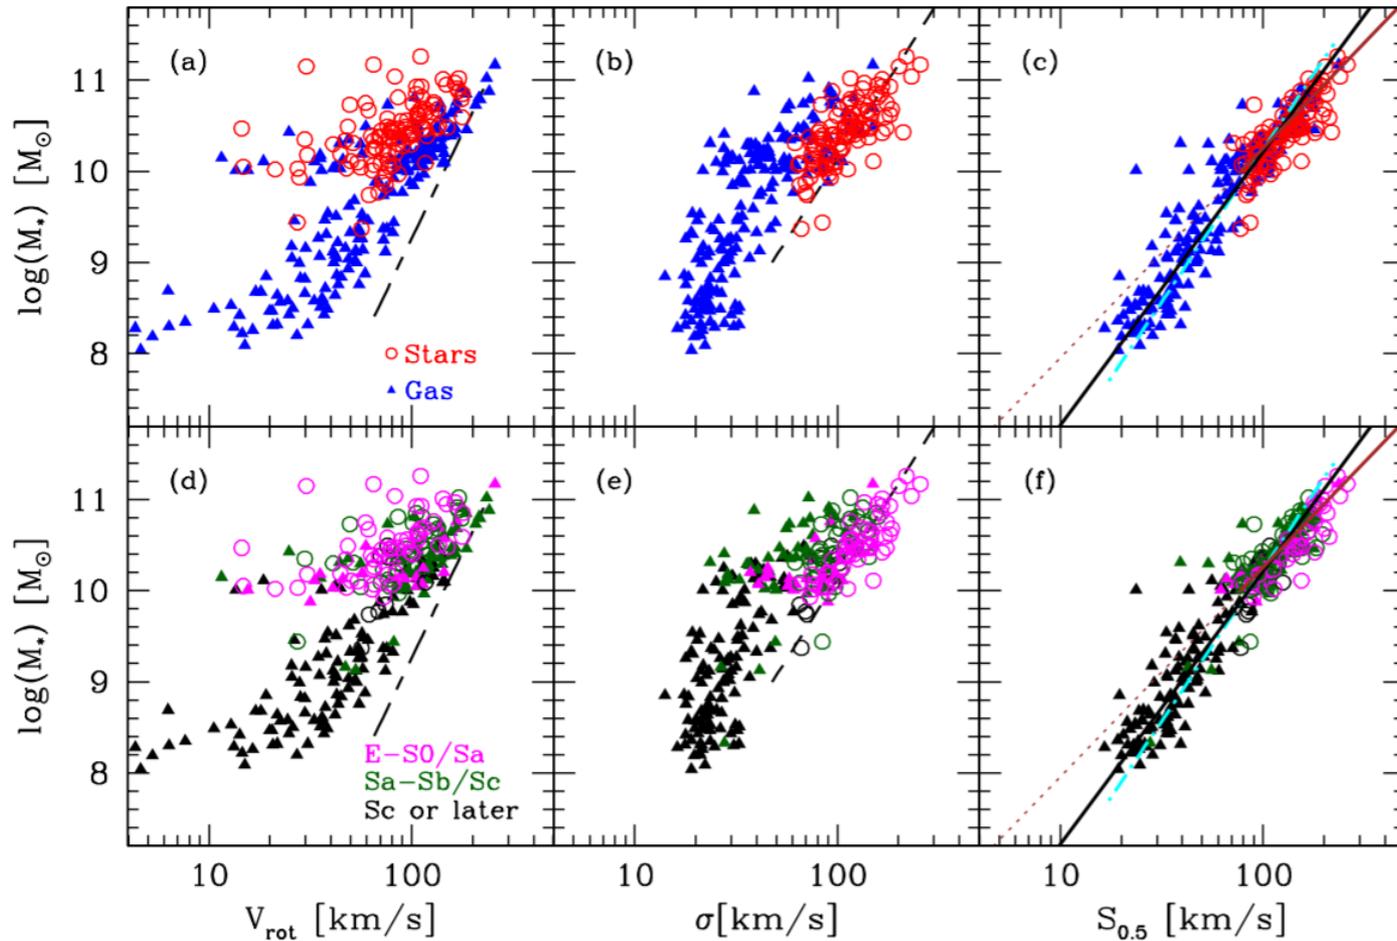

其它球状动力学系统？

Dynamical scaling relation

arXiv1410.3931

$$S_{0.5} = \sqrt{0.5V_{rot}^2 + \sigma^2}$$

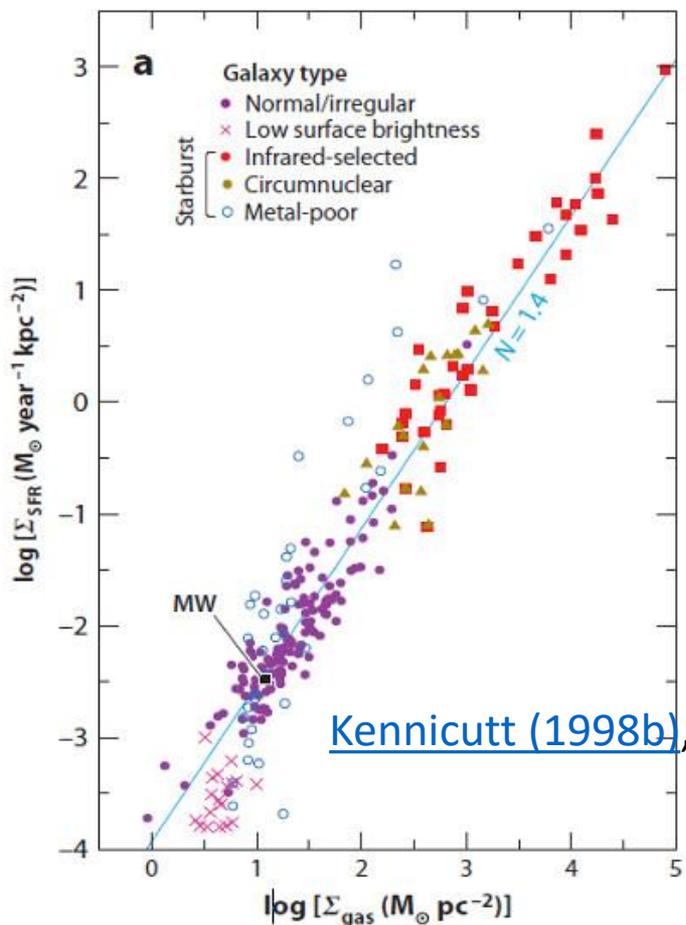

作业

- 某旋涡星系和椭圆星系，其观测到的I波段的视星等都是18等；半光度半径内的表面亮度都是 20mag/arcsec^2 ；其中旋涡星系观测得到的HI的速度展宽是 200km/s ，椭率为0.5，椭圆星系观测到的中心速度弥散度是 200km/s ，请问这两个星系的距离分别是多少？
 - 旋涡星系的 Tully-Fisher关系以及椭圆星系的 Fundamental Plane的内秉弥散在0.2个星等左右，请问以上距离计算的误差是多少？

3.2 恒星形成相关

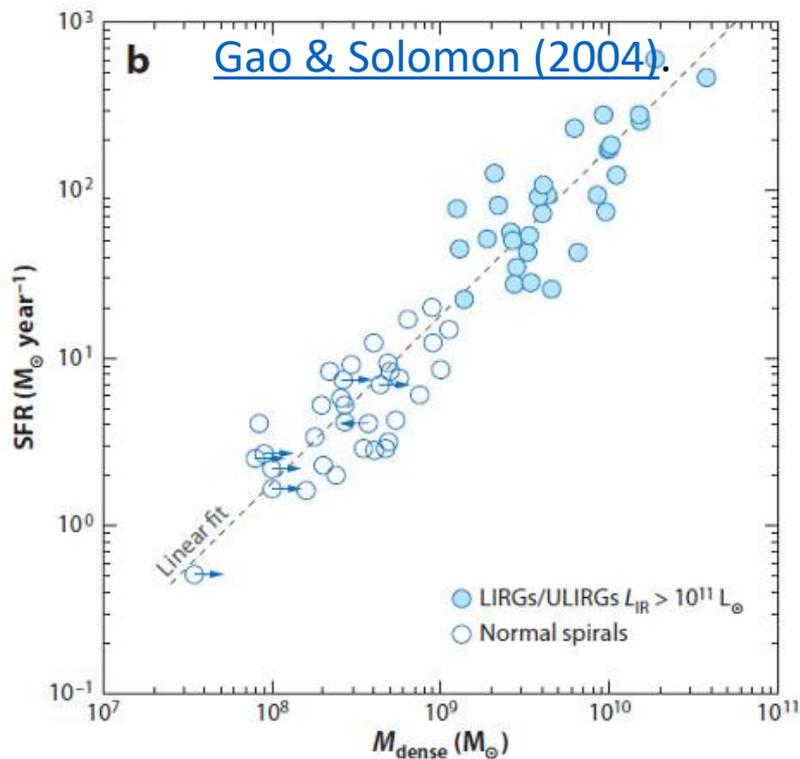

Kennicutt–Schmidt law

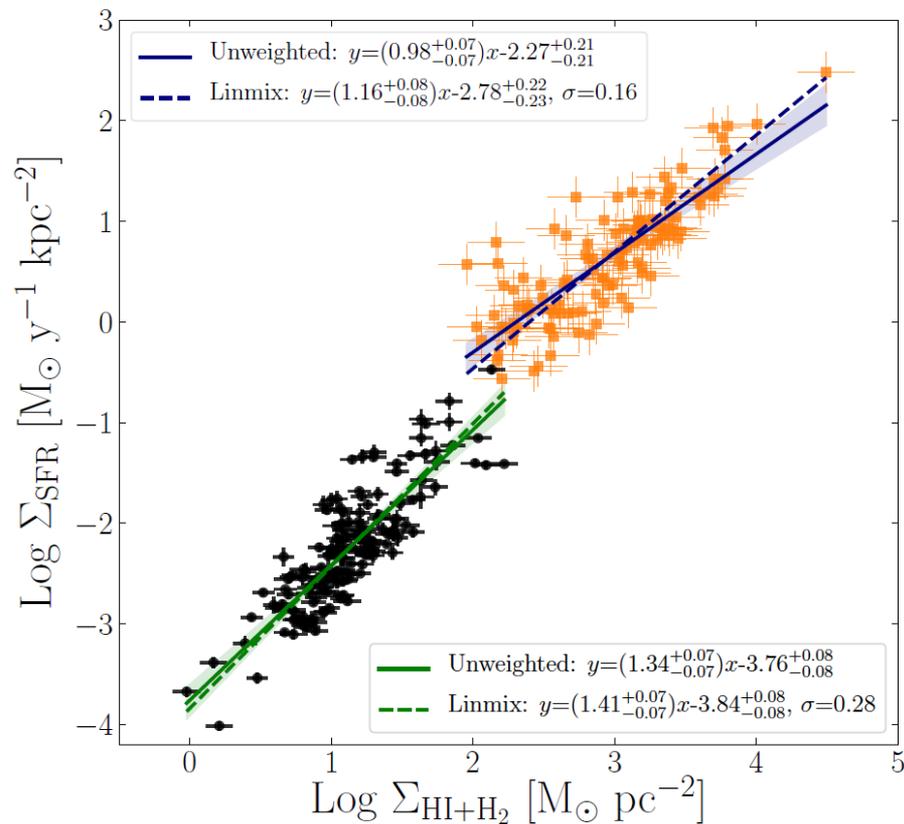

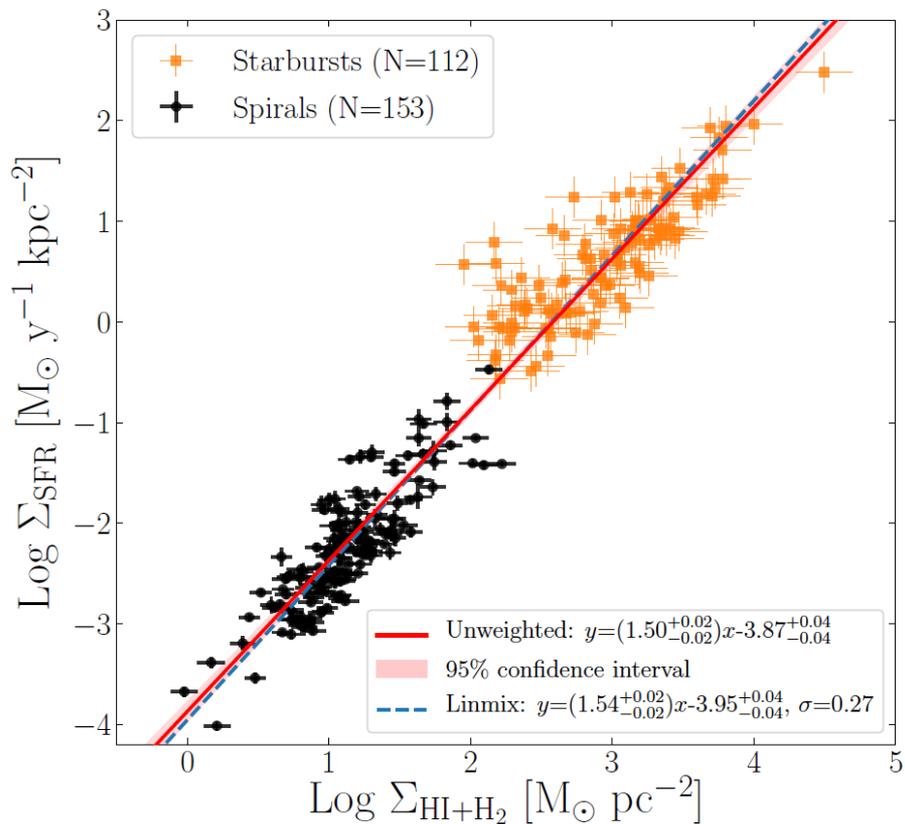

$$\Sigma_{SFR} = A \Sigma_{gas}^N$$

>Kpc尺度

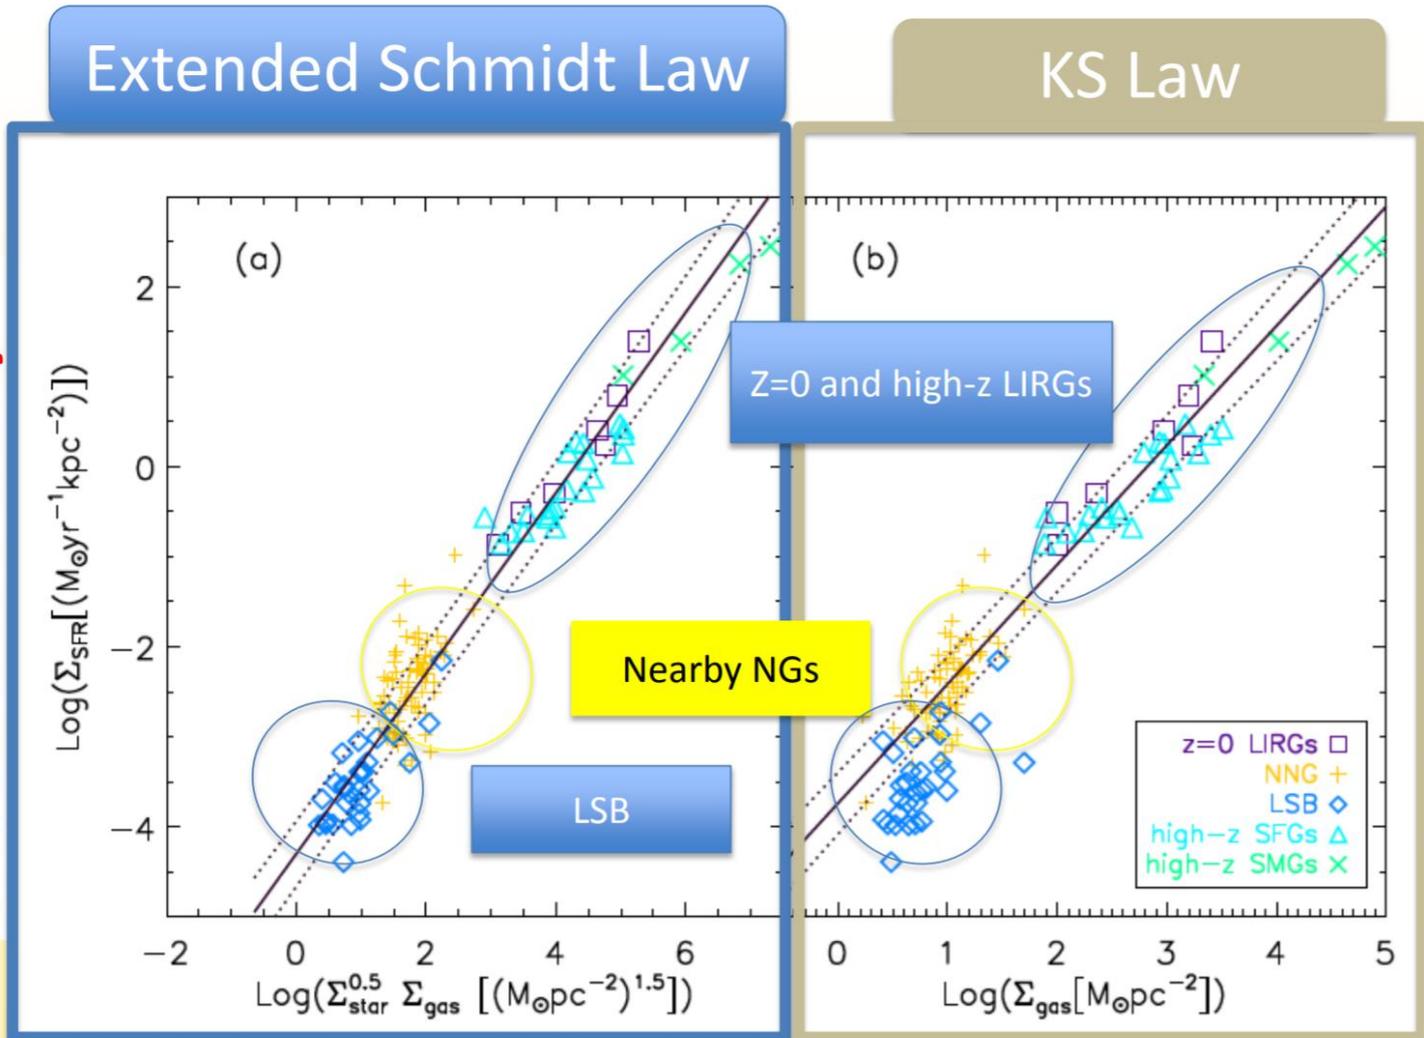

N=1.4

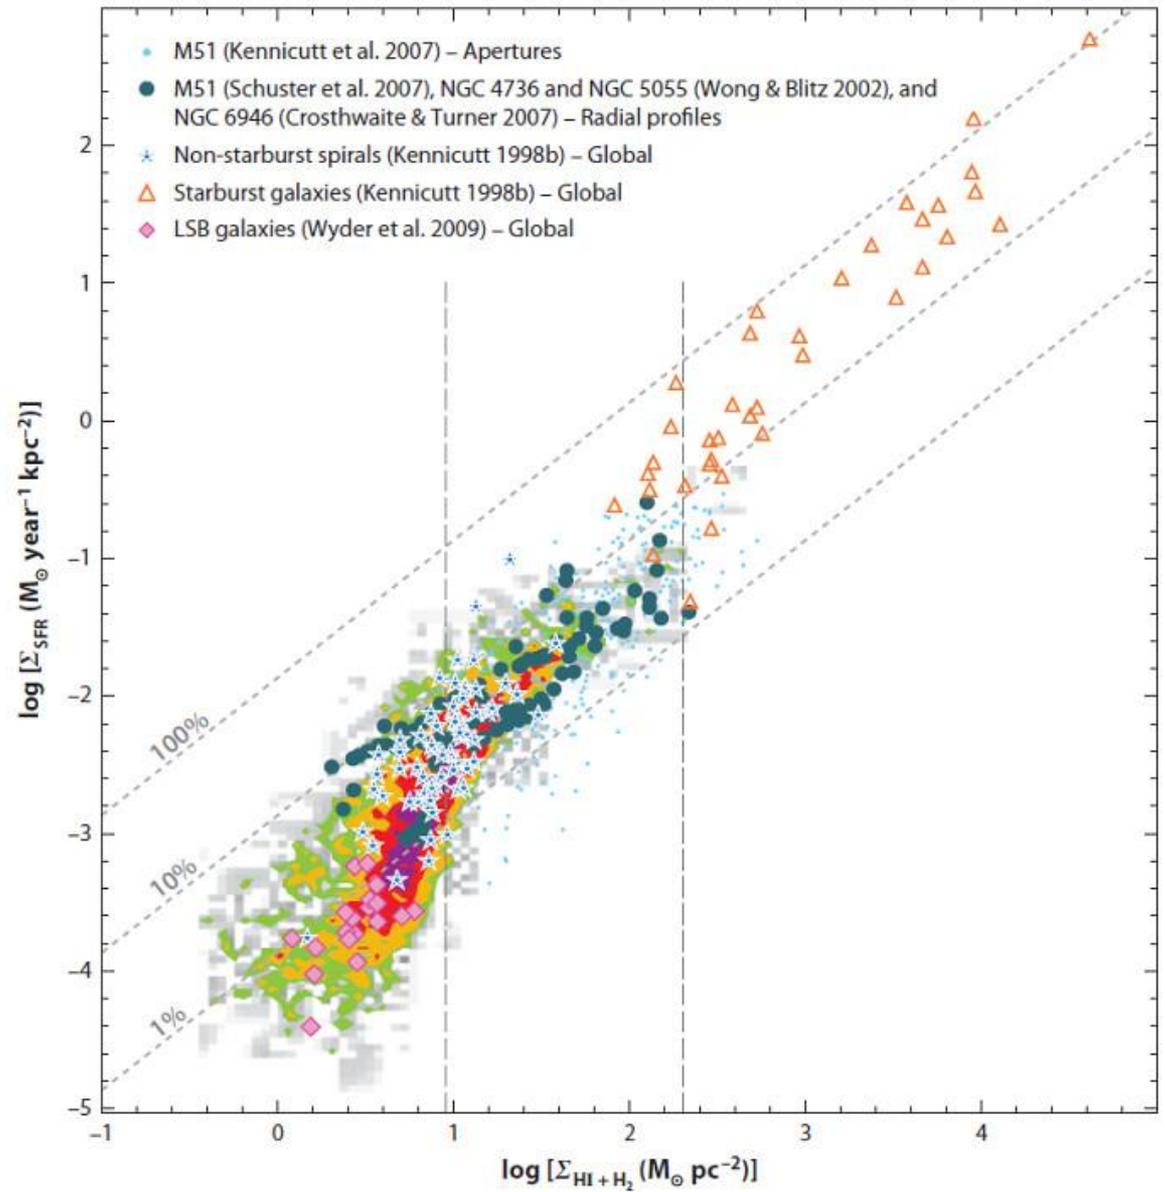

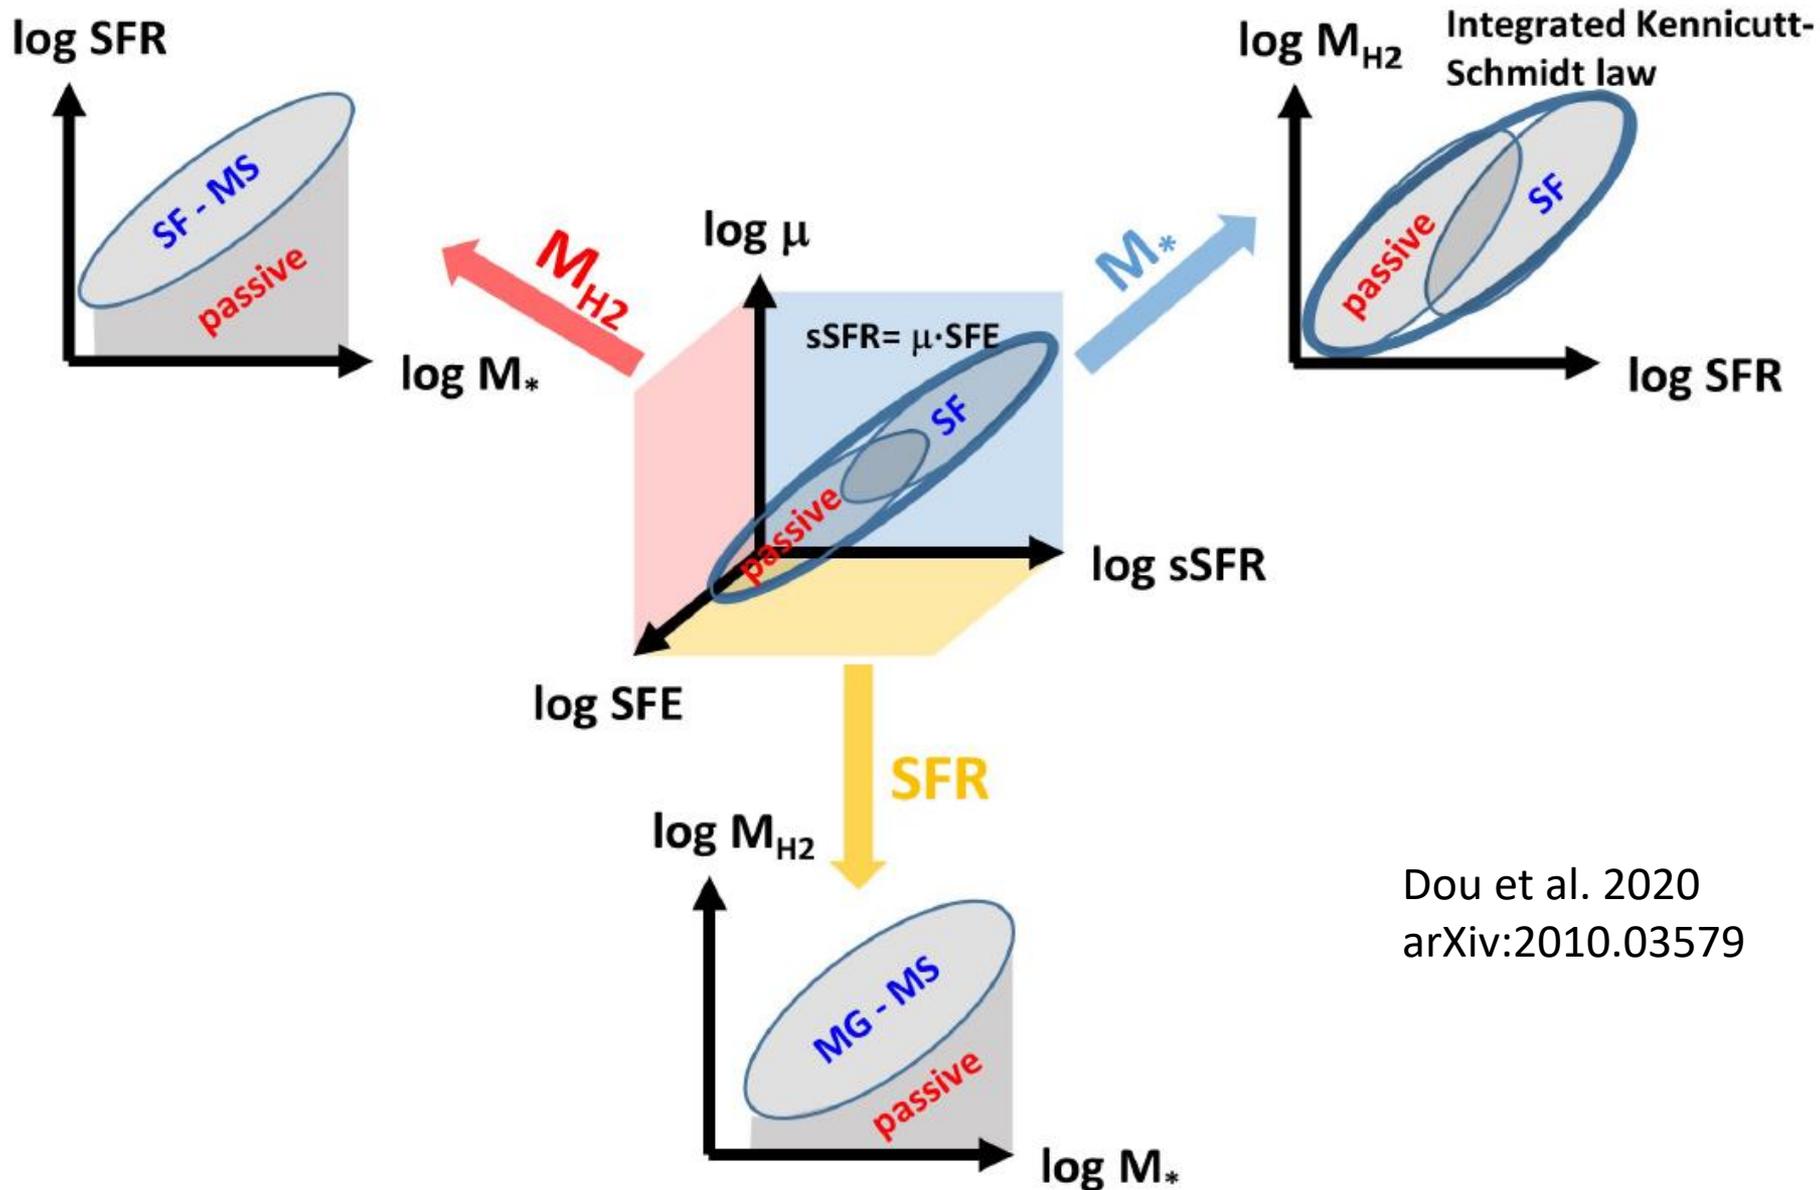

Extended Schmidt law (Shi et al. 2011)

SFR Surface Density

Sub-kpc 尺度

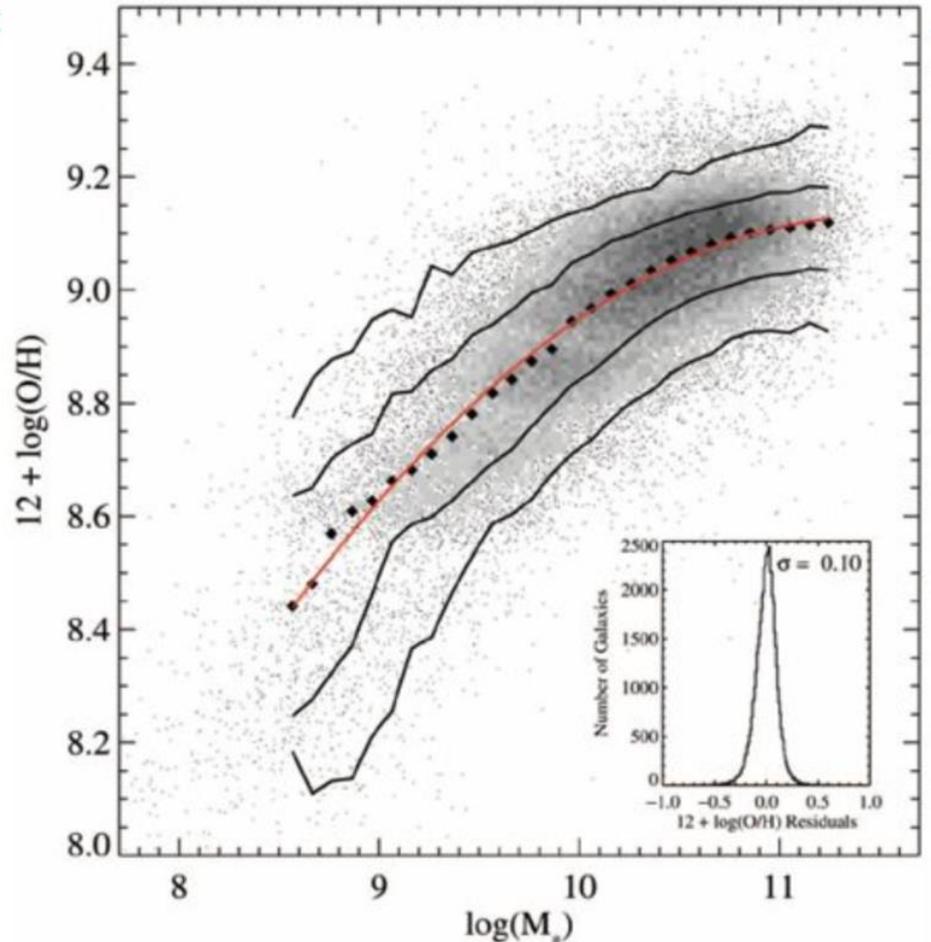

Dou et al. 2020
arXiv:2010.03579

3.3 金属丰度相关

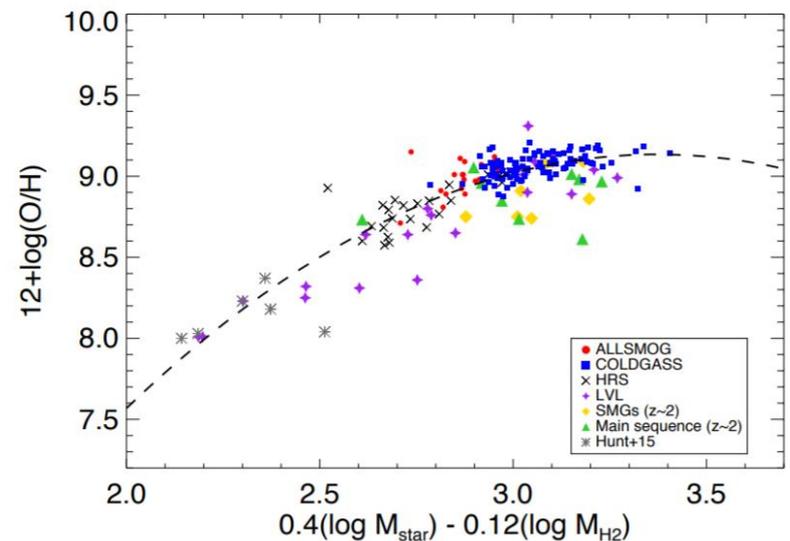

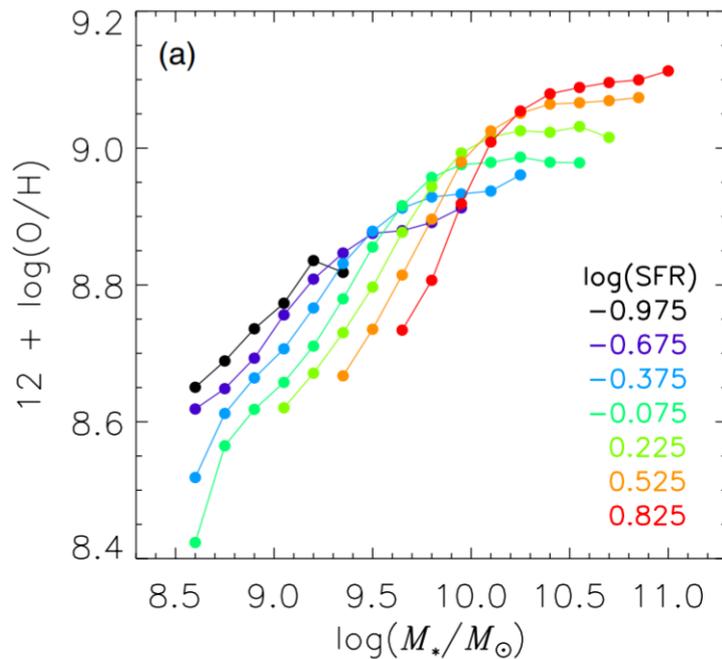

质量---金属丰度关系

- 大质量星系
 - 势井更深
- 其它模型：
 - 大质量星系的恒星形成效率更

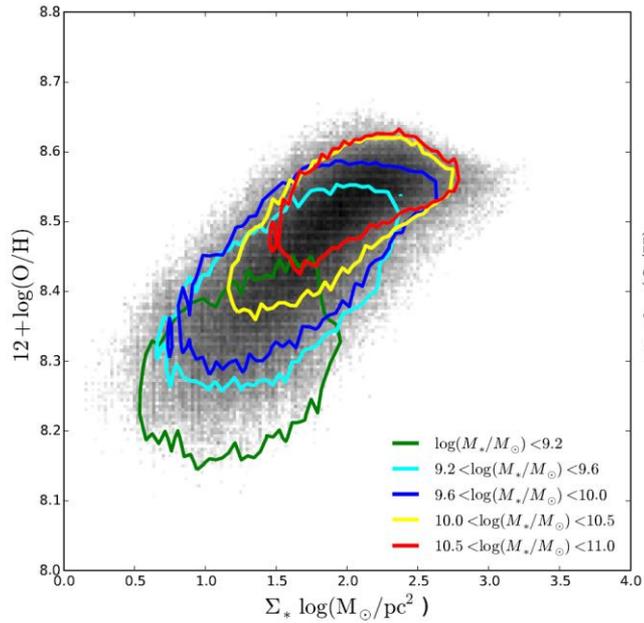

Fundamental metallicity relation (FMR)

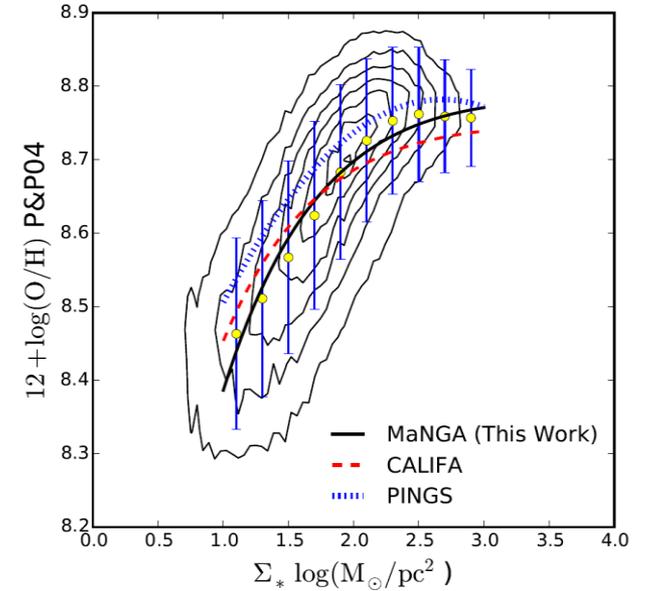

- M_* , gas-phase metallicity, SFR ([Mannucci et al.2010](#))
 - 小质量端：气体内落稀释金属丰度
 - 大质量端：恒星形成星系富含气体

Local MZ relation: **Surface mass density**

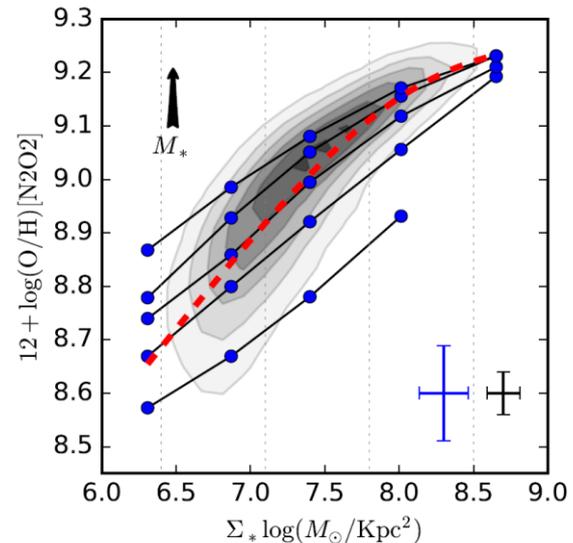

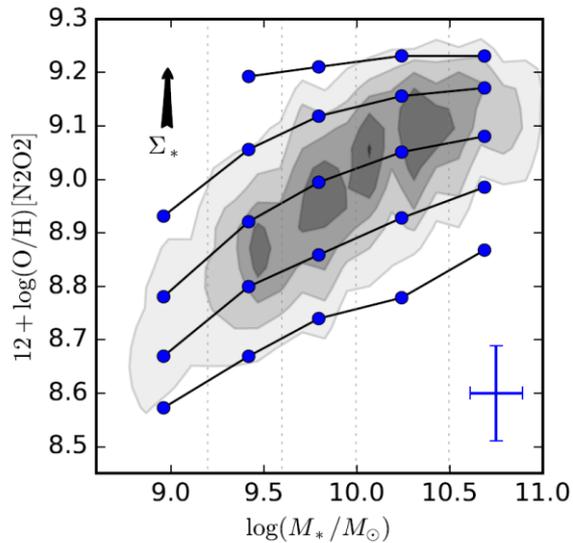

Barrera-Ballestero et al. 2016

Gao et al. 2018 $(M_* - \Sigma_* - Z)$ relation

5

3.4 线性标度率的拟合

$$Y = ax + b$$

Famous linear scaling relations in astronomy

- period -luminosity relation of Cepheids
- $M_{\text{BH}}-\sigma$ relation
- Tully-Fisher ($L - V_{\text{max}}$) relation
- Fundamental plane of ellipticals
- $L-T$, $L-\sigma$ relation of groups and clusters
- All are statistical scaling relations, none of them are first principle like $F=ma$

Nature of the scaling relations

- Observables: (x_i, y_i) with error $(\Delta_{x,i}, \Delta_{y,i})$
- First, we should find some correlations, e.g. rank analysis
- To the first order, all the correlations are linear
- $Y = a * X + b + \sigma$
 - σ is the intrinsic scatter, may not be a constant
- Observables maybe biased
 - e.g. some low-luminosity galaxies are not observed at given V_{\max}
- Some observables may only be upper limits
 - E.g. we only get the upper-limit of L_x of some cluster

Ordinary Linear regression

OLS($y|x$)

- y_i with measurement error σ_i

$$\chi^2(a, b) = \sum_{i=1}^N \left(\frac{y_i - a - bx_i}{\sigma_i} \right)^2$$

Code: *fit* in numeric recipes

Error on both x and y

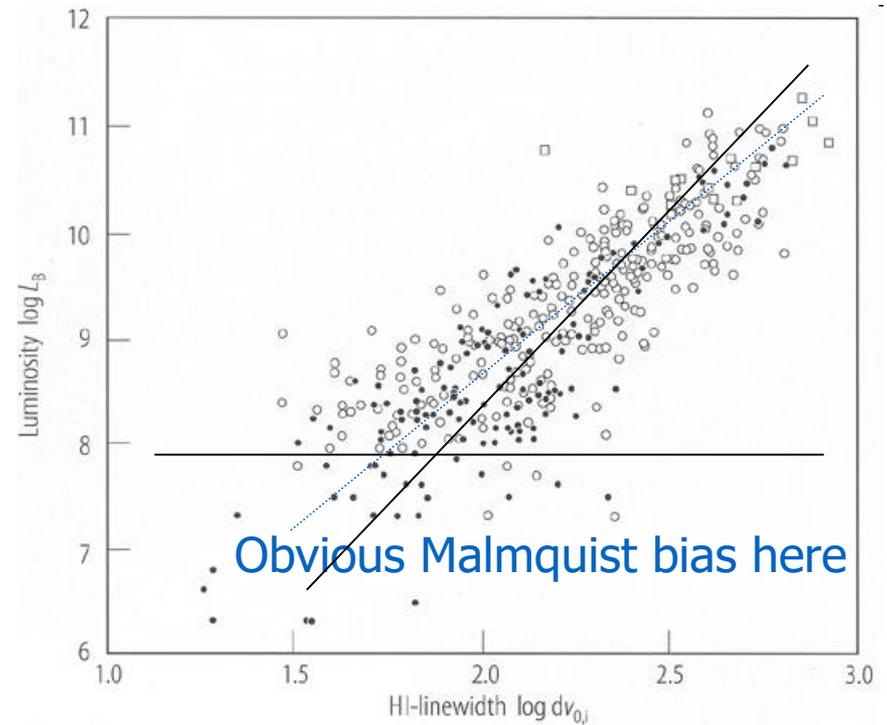

$$\chi^2(a, b) = \sum_{i=1}^N \frac{(y_i - a - bx_i)^2}{\sigma_{y_i}^2 + b^2 \sigma_{x_i}^2}$$

Code: *fitexy* in numeric recipes

b ~ biased to infinity

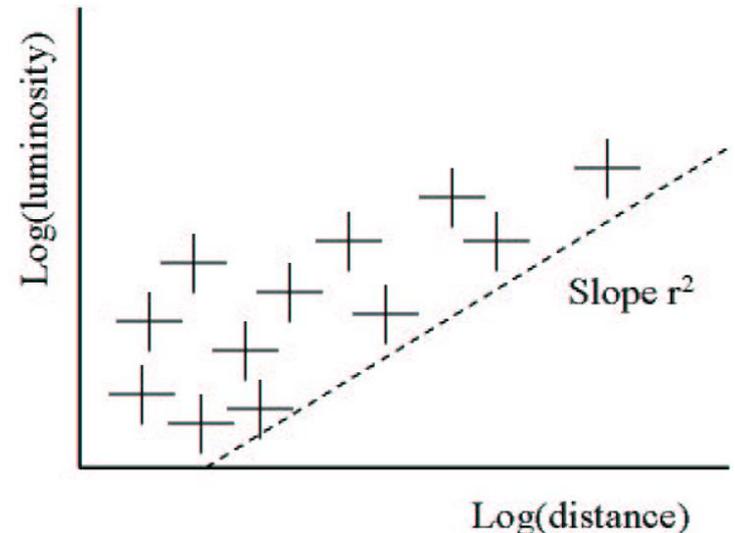

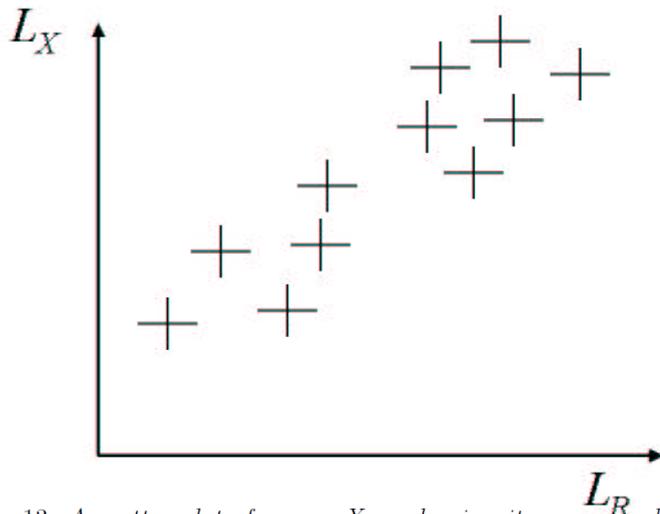

Caveat: choose proper parameterization

- If we fit $M = a \log W + b$, a will be biased to smaller values
- Fit $\log W = a' M + b'$ is better
 - At given M , no obvious in W

Eddington(Malmquist) bias

- Distance dependent observable
 - Eddington (1915) Malmquist(1920)
 - In magnitude limit sample, more faint source scattered in than bright source scattered out

Six different linear regression

- Reference

- Linear regression in astronomy I (1990, ApJ,364,104)
 - Different regression method
- Linear regression in astronomy (1992ApJ...397...55)
 - Truncated, censored data

- IDL code: `sixlin`

- Ordinary Least Squares (OLS) Y vs. X (c.f. `linfit.pro`)
- Ordinary Least Squares X vs. Y
- Ordinary Least Squares Bisector
- Orthogonal Reduced Major Axis ;
- Reduced Major-Axis
- Mean ordinary Least Squares

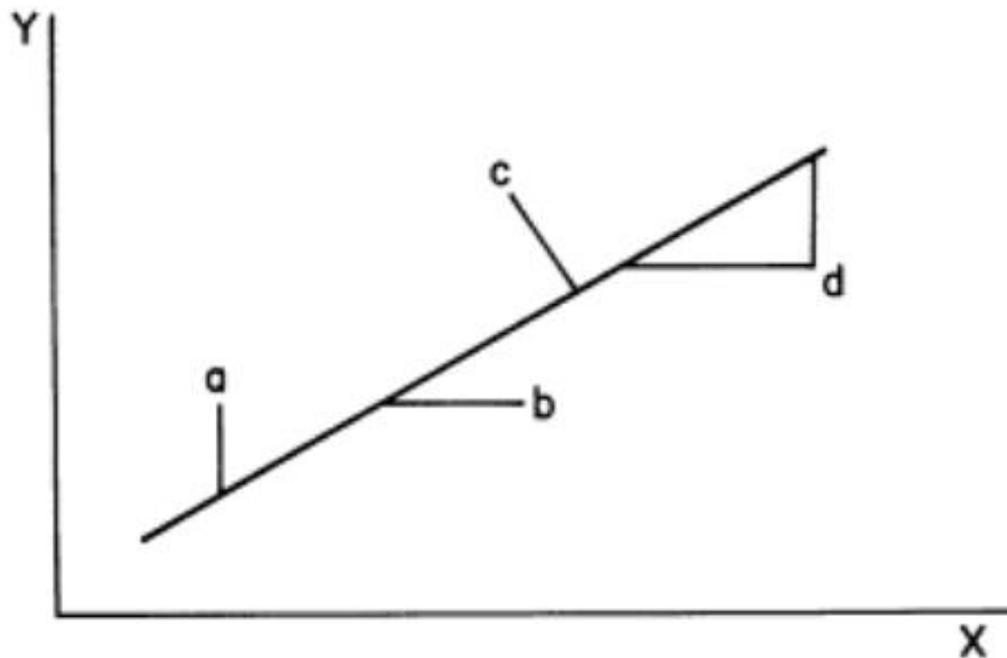

FIG. 1.—Illustration of the different methods for minimizing the distance of the data from a fitted line: (a) $OLS(Y|X)$, where the distance is measured vertically; (b) $OLS(X|Y)$, where the distance is taken horizontally; (c) OR, where the distance is measured vertically to the line; and (d) RMA, where the distances are measured both perpendicularly and horizontally. No illustration of the OLS bisector is drawn in this figure.

- The applicability of the procedures is dependent on the nature of the astronomical data under consideration and the scientific purpose of the regression.
- For problems needing symmetrical treatment of the variables, the OLS bisector performs significantly better than orthogonal or reduced major-axis regression.

Error on both x and y and with a constant intrinsic scatter σ

$$\ln L = -\frac{1}{2} \sum_i \ln(\sigma^2 + \sigma_{y,i}^2 + a^2 \sigma_{x,i}^2) - \sum_i \frac{[\hat{y}_i - (a\hat{x}_i + b)]^2}{2(\sigma^2 + \sigma_{y,i}^2 + a^2 \sigma_{x,i}^2)} + \text{constant.}$$

BCES (Akritas & Bershad, ApJ 470, 706 1996)

- Regression with correlated measurement errors and intrinsic scatter
 - allows for measurement errors on both variables
 - allows the measurement errors for the two variables to be dependent
 - allows the magnitudes of the measurement errors to depend on the measurements
- Intrinsic scatter: constant
- IDL code: BCES.pro (BCES: bivariate, correlate errors and scatter)

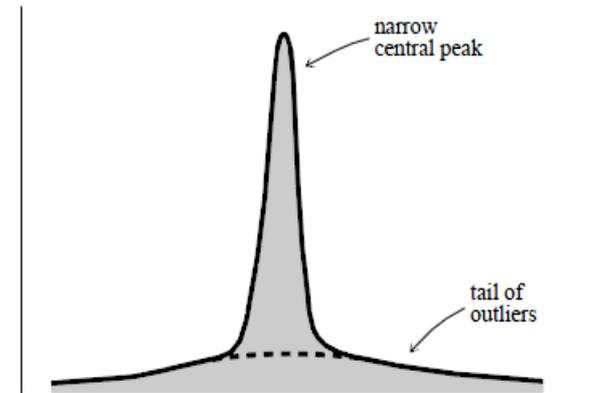

Special cases

Robust estimation

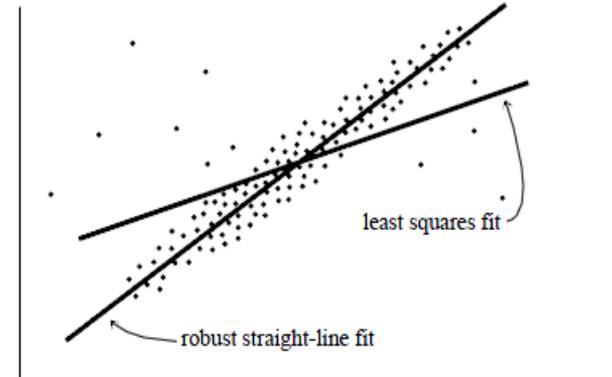

- Data with outlier

minimize over \mathbf{a}
$$\sum_{i=1}^N \rho \left(\frac{y_i - y(x_i; \mathbf{a})}{\sigma_i} \right)$$

$$\sum_{i=1}^N |y_i - a - bx_i|$$

(a)

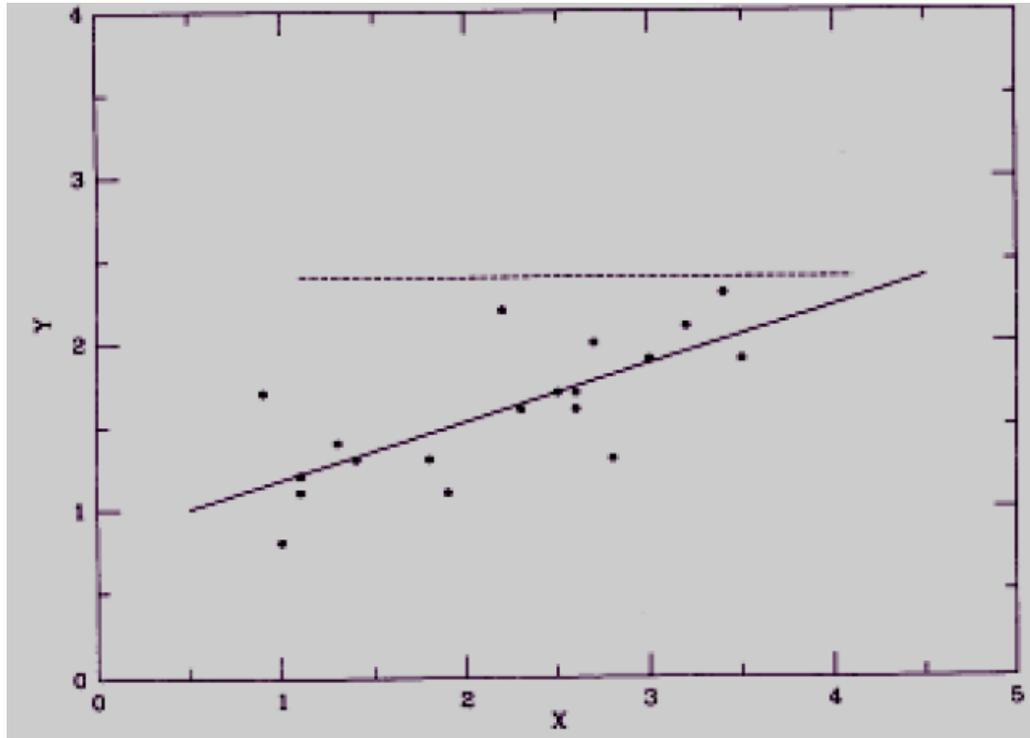

(b)

See Numeric recipes C15.7

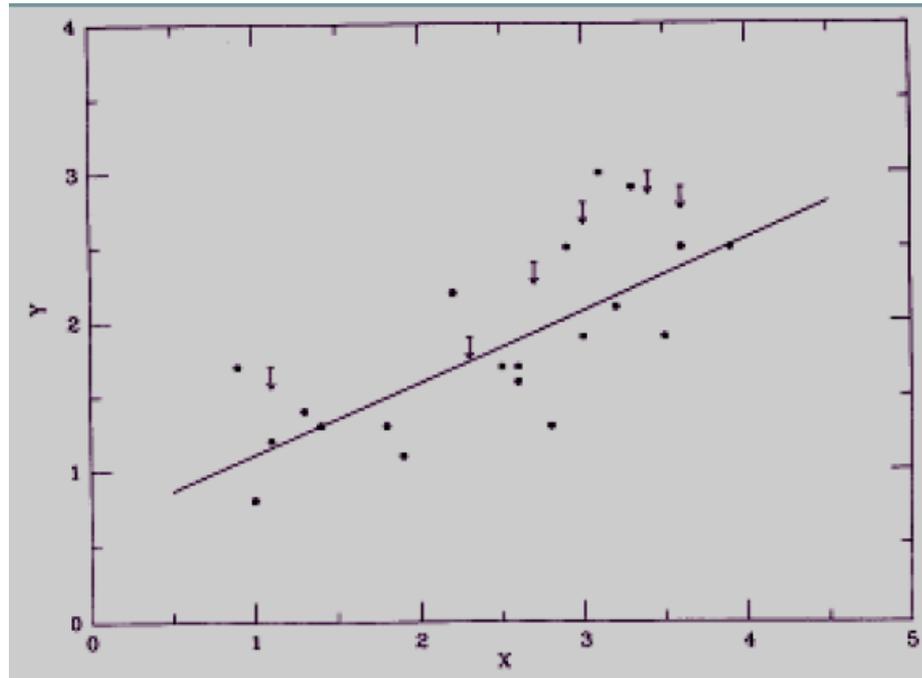

Figure 15.7.1. Examples where robust statistical methods are desirable: (a) A one-dimensional distribution with a tail of outliers; statistical fluctuations in these outliers can prevent accurate determination of the position of the central peak. (b) A distribution in two dimensions fitted to a straight line; non-robust techniques such as least-squares fitting can have undesired sensitivity to outlying points.

Truncation due to flux limits

Malmquist bias in Hubble diagram (Deeming, *Vistas Astr* 1968, Segal, *PNAS* 1975)

Censoring due to non-detections

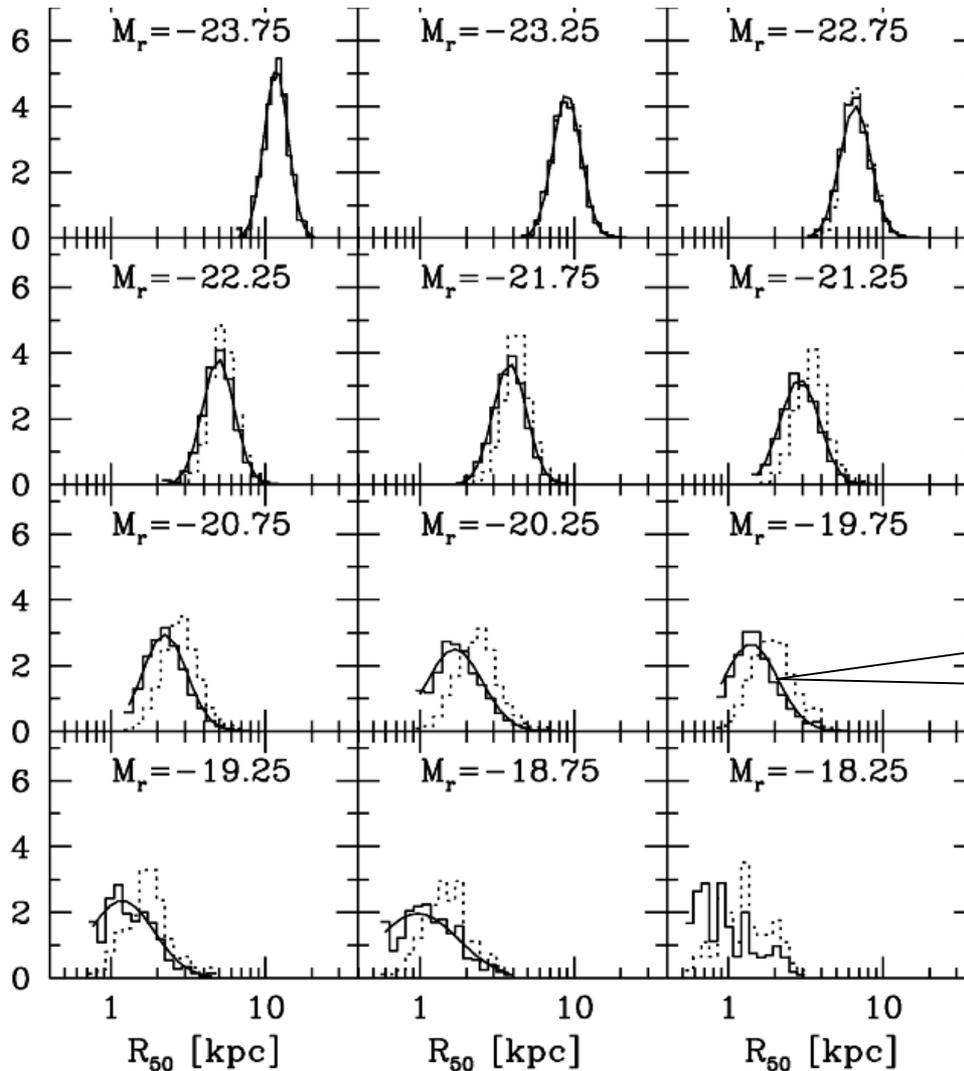

**Presented for astronomy by Isobe, Feigelson & Nelson (ApJ 1986)
Implemented in Astronomy Survival Analysis (ASURV) package**

A more straight-forward way

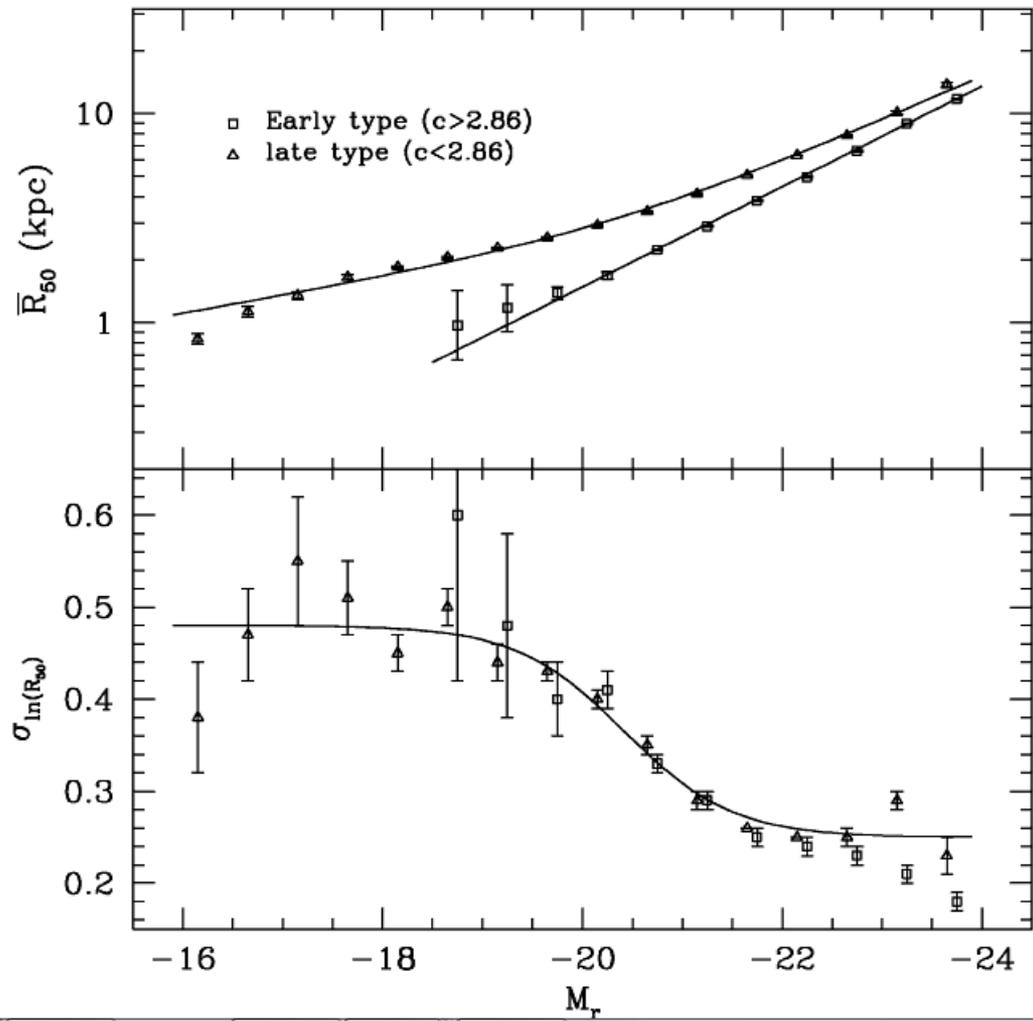

- Especially when amount of data is large in modern surveys
- First, at given bin of x , what is the distribution of y after correction for selection bias?
 - Is y Gaussian distributed? What is the scatter compared with its measurement error?
- Then what is the $\text{PDF}(y|x)$ changes as function of x
 - Is this relation linear or non-linear?
- Build the likelihood function and fit the model parameters

L – R relation of galaxies (Shen et al. 2003)

We find, after correction for selection effect, at given M_r , $\text{Log } R$ is intrinsically Gaussian distributed.

Data is biased here

We plot $P(R|M)$ as function of M .

Intrinsic scatter is not a constant
